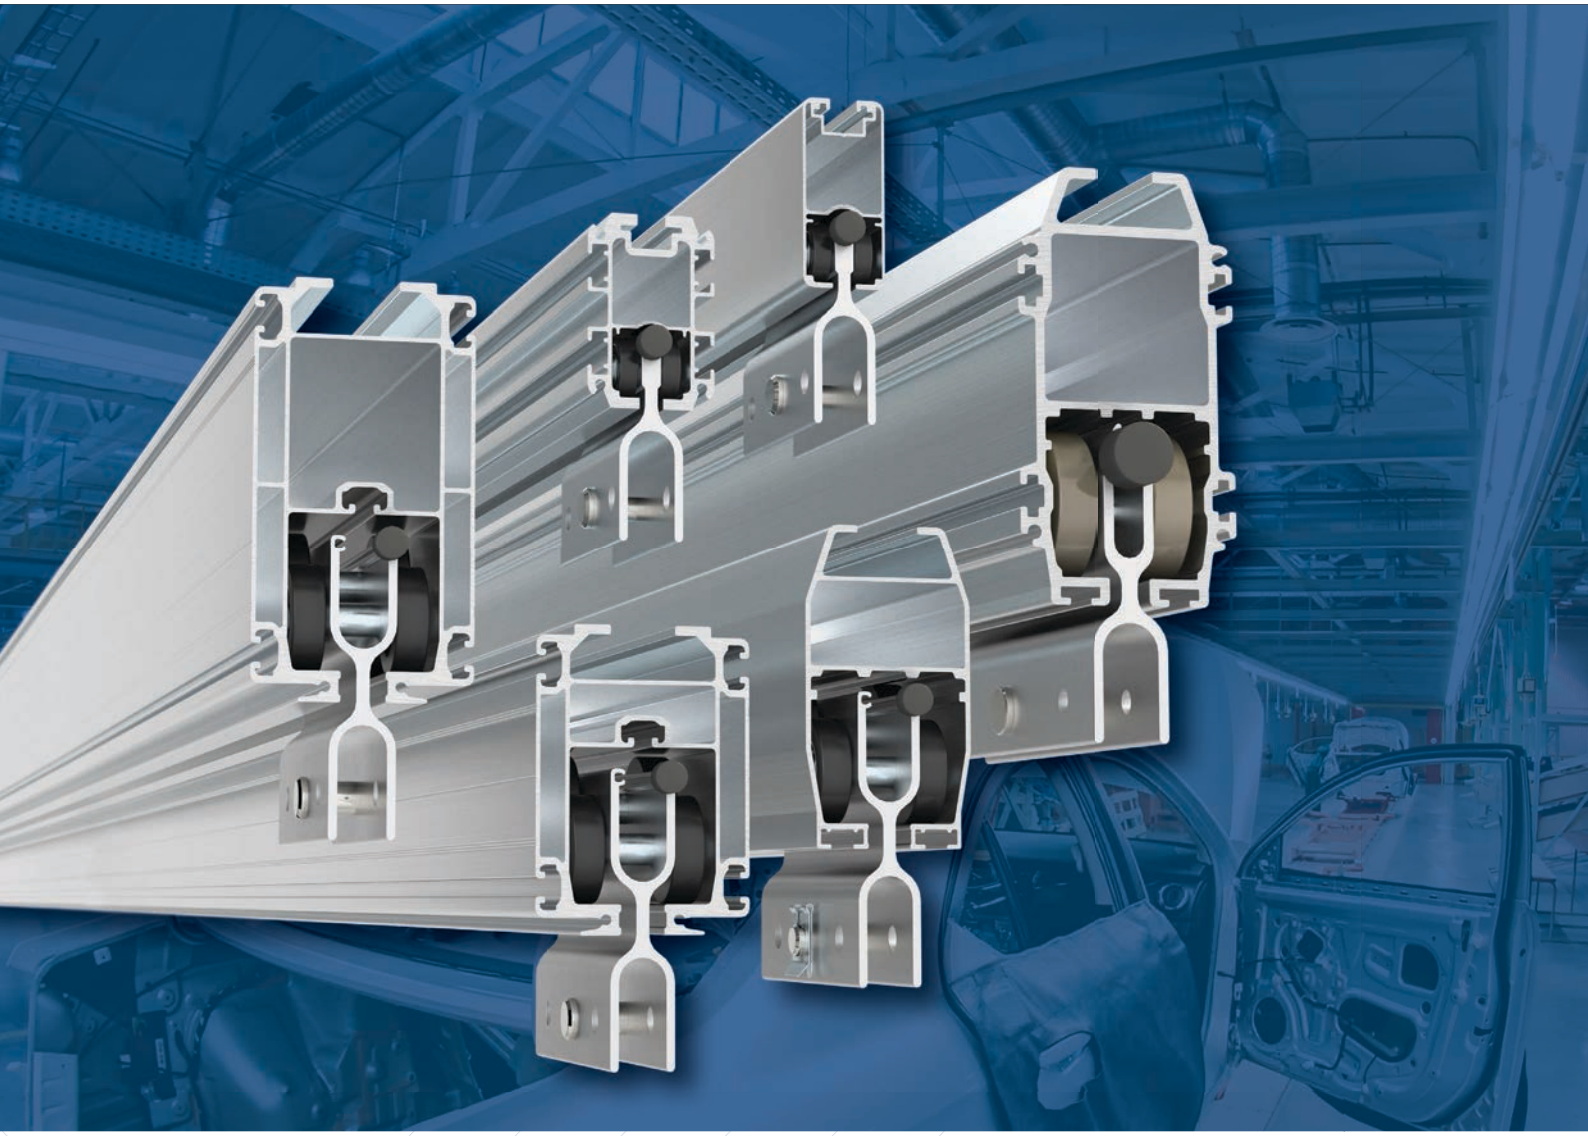
WORLD-CLASS LIFTING SOLUTIONS



MECHRAIL™

LIGHTWEIGHT OVERHEAD HOIST SYSTEM IN ALUMINIUM

CATALOGUE 2018

TABLE OF CONTENTS

ABOUT LIGHTWEIGHT OVERHEAD HOIST SYSTEMS IN GENERAL

This product catalogue describes the various components in the Mechrail range of equipment and basic rules for selection. The product catalogue supports other sales tools for a correct selection of products. This document contains standard products available in price lists and sales configurator as well as some special applications that require handling by the Movomech sales support department.

TERMINOLOGY FOR LIGHTWEIGHT OVERHEAD HOIST SYSTEMS

Light-weight overhead hoist systems

A system with aluminium rails in which carriages, supports, lifting equipment and ancillaries are attached in order to provide ergonomic and flexible movement in the X and Y axles when lifting.

Runway

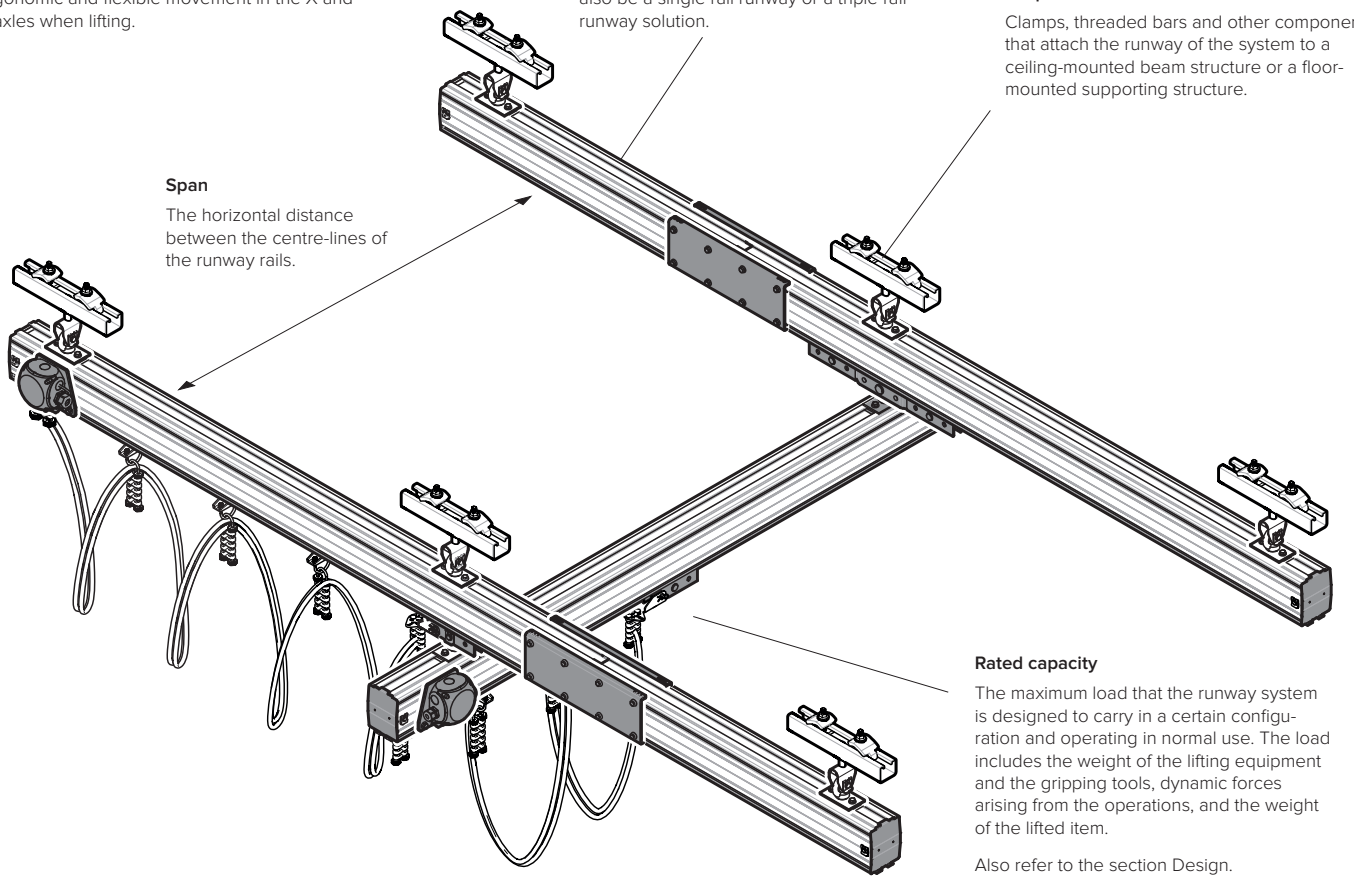
Stationary aluminium rails on which a hoist or other lifting equipment travels. A runway usually consists of two runway rails, but may also be a single rail runway or a triple rail runway solution.

Suspension

Clamps, threaded bars and other components that attach the runway of the system to a ceiling-mounted beam structure or a floor-mounted supporting structure.

Span

The horizontal distance between the centre-lines of the runway rails.

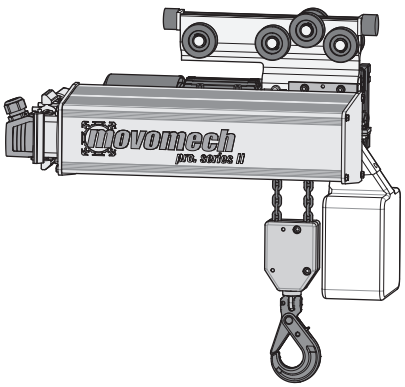


Rated capacity

The maximum load that the runway system is designed to carry in a certain configuration and operating in normal use. The load includes the weight of the lifting equipment and the gripping tools, dynamic forces arising from the operations, and the weight of the lifted item.

Also refer to the section Design.

An example of a simple ceiling-mounted overhead hoist system for e.g. lifting with an electric chain hoist.



Lifting equipment

The equipment needed to lift and lower a load.

GENERAL CHARACTERISTICS

About the Mechrail™ lightweight overhead hoist systems

Mechrail™ is a modular lightweight overhead hoist system of light aluminium rails for manual or powered handling of goods, designed to be used together with a number of different lifting devices.

The lightweight overhead hoist system is designed to be attached to a ceiling-mounted beam structure or a floor-mounted supporting structure. The system must be dimensioned for the forces acting on it when in operation, and this must be verified before commissioning the overhead hoist system.

Because of the hanging design, most cases will only have downward-going forces on the supporting structure. An exception is in case upward-going forces are created, e.g. if a torque absorbing load manipulator is mounted close to a runway.

Technical Regulations

The Movomech range of products are designed according to the state of the art for technical equipment, and meets the requirements in the applicable European Norms and Regulations. The Standards and Directives that apply to the product are stated in the Declaration of Conformity or the Manufacturers declaration supplied with the product.

Safety Precautions

The documentation provides appropriate instructions for the user to ensure safe operation and simple maintenance.

All personnel that transport, install, put into use, operate, maintain and repair the Movomech equipment and attached equipment must have read and understood:

- the Operating Instructions,
- the Safety Instructions, and
- the Safety Precautions in the various sections.

To avoid erroneous use and to ensure uninterrupted operation with our products, these Operating Instructions must always be available for the user/operator.

Installing the Lightweight Overhead Hoist System

The overhead hoist system must be installed using authentic components supplied or approved by Movomech. Components from other sources may carry a risk for the equipment or the personnel and voids any warranty claim.

When installing the equipment all safety and installing instructions in the manual must be observed and the installation work must be documented. During the installation work the work area must be closed for unauthorized persons.

The installation work requires skilled personnel and suitable tools in order to ensure safe and reliable operation. We recommend that the installation work is only performed by authorized personnel or an experienced service technician, authorized by the manufacturer.

Preventive Maintenance

The overhead hoist system is designed using nodular components requiring minimal maintenance. As a general rule, the tightening torques of the screw joints must be check regularly, and also the state of the safety equipment and wear parts. The intervals for preventive maintenance depend on the actual usage of the system, but should be performed at least annually.

See the product manual for further information.

COMPONENT PROPERTIES

Runway rails

The Mechrail runway rails are made of aluminium. They are anodized and require no maintenance. They are manufactured in EN-AW 6063 T6 aluminium alloy according to SS-EN 755-2:2016, anodized colour C0 (natural).

Accessory range

A large part of the components in the Mechrail range are coated by galvanizing or anodizing, which makes them better resistant against wear and tear than painted components.

TEMPERATURE AND ENVIRONMENTAL CONDITIONS

Temperature and environmental limitations

This product is designed to be used indoors in typical industrial environments such as production spaces for the vehicle industry and general manufacturing.

Temperature range +5 to +40 °C.

Atmospheric corrosion category C2.

Noise level < 70dB (A).

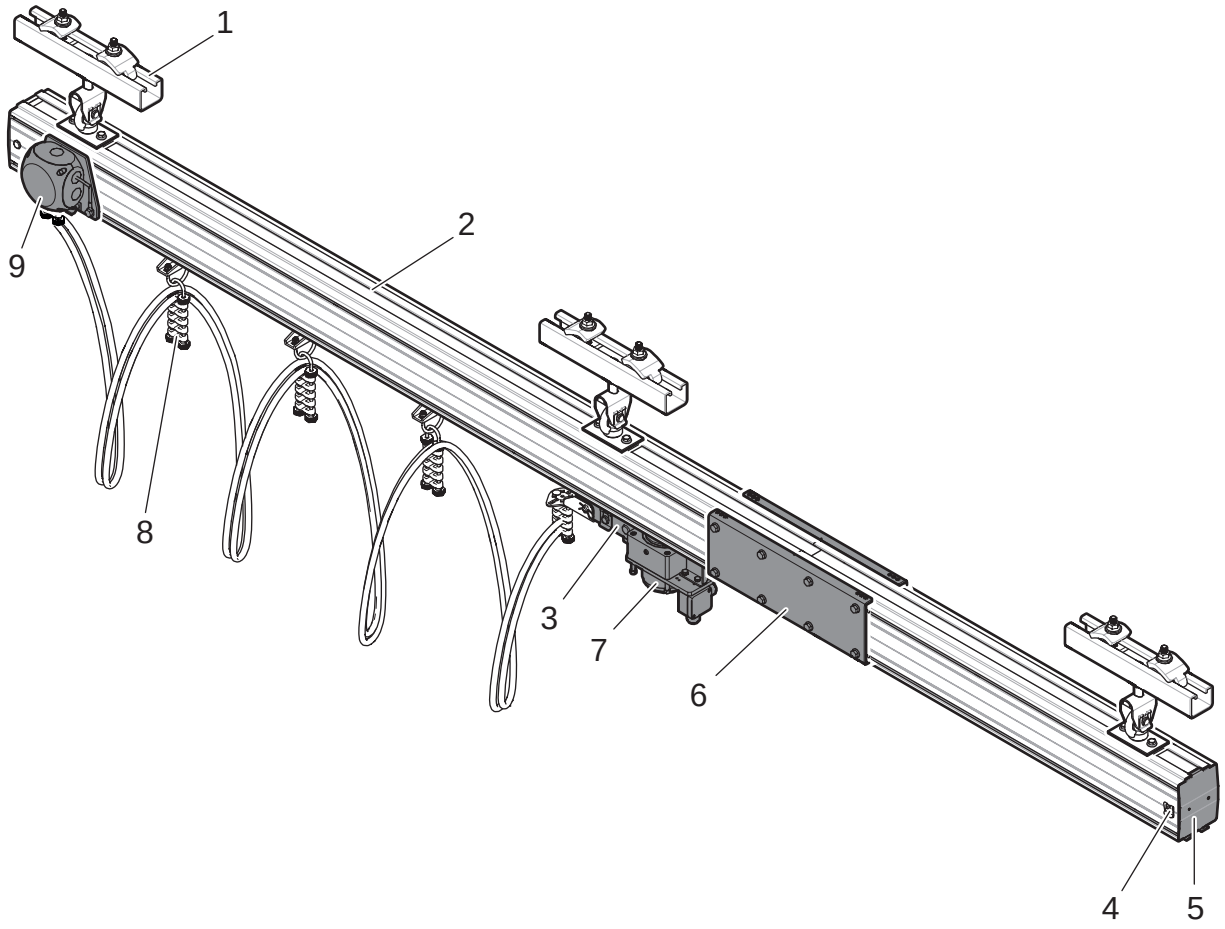
ATEX

This product is not ATEX classified according to the EU directive for equipment in explosive environments.

CONFIGURATION EXAMPLE

Example 1: Single runway

Single runway - flexible suspension
Media supply - cable carriages

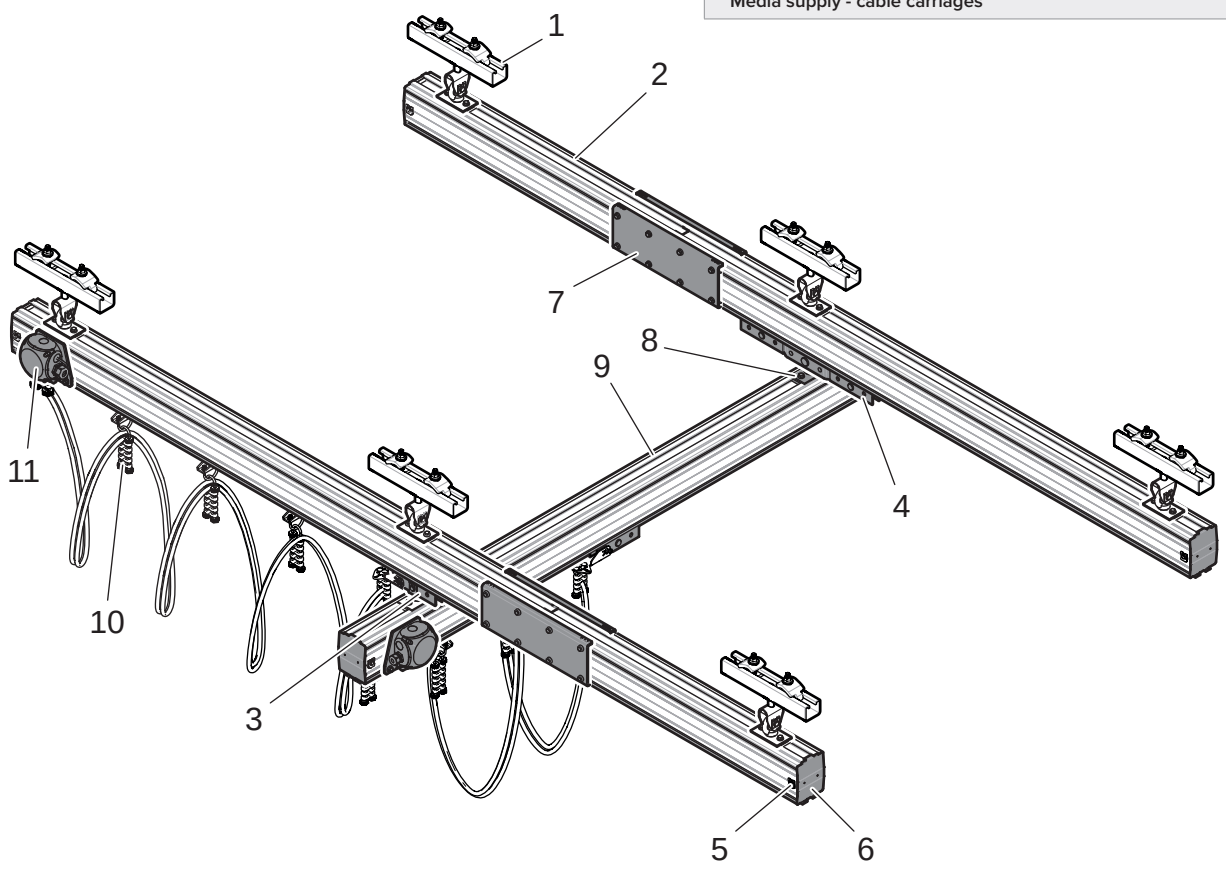


Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Brake	(A) Electric 230 V	page 56	
8	Media supply	Cable carriage	page 61	
9	Connecting unit	AHB140/190	page 84	

A single runway is used in applications that only require movement in one direction.

Example 2: Single bridge

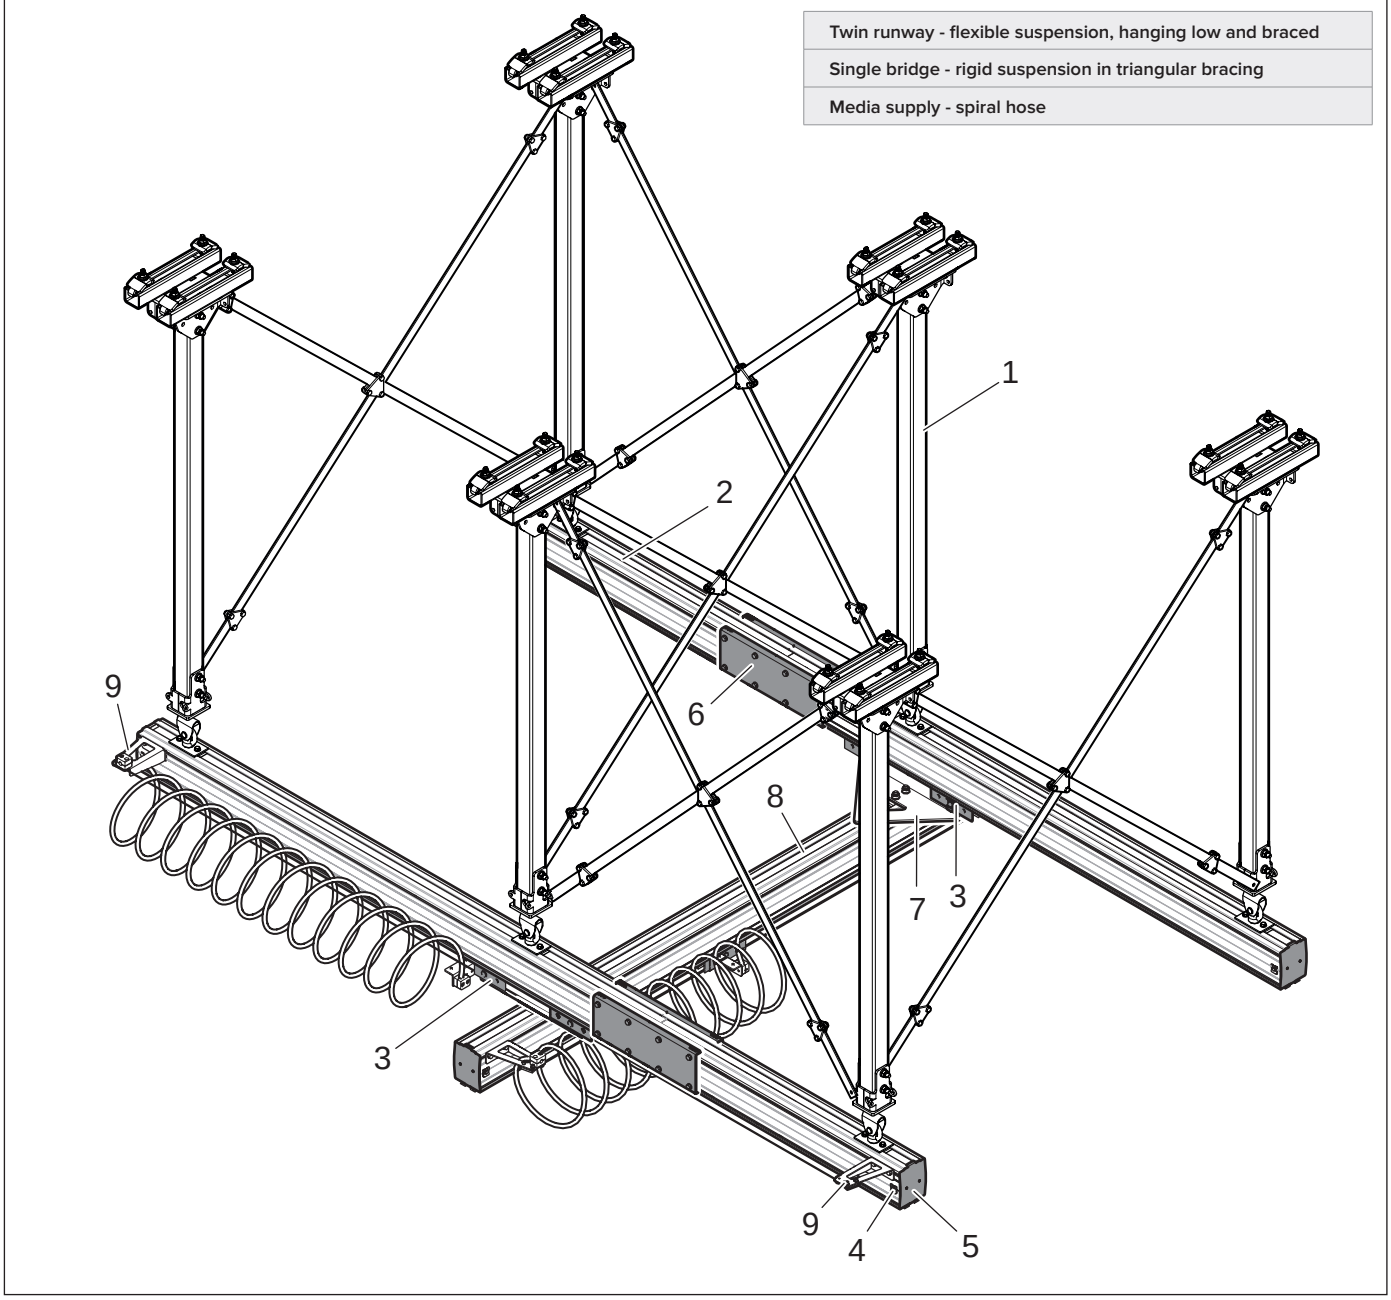
Twin runway - flexible suspension
Single bridge - flexible suspension
Media supply - cable carriages



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	Trolley	(B) Twin trolley	page 38	
5	End stop	AHB140/190	page 40	
6	End cover	AHB140	page 42	
7	Fishplate kit	AHB140	page 43	
8	Bridge suspension	Crane beam suspension (A)	page 44	
9	Rail, bridge	AHB140	page 28	
10	Media supply	Cable carriage	page 61	
11	Connecting unit	AHB140/190	page 84	

Twin runway with single bridge suspended in a crane beam suspension (A) is the most common way to configure a rail system when using non-torque absorbing lifters.

Example 3: Long suspensions and triangular bracing

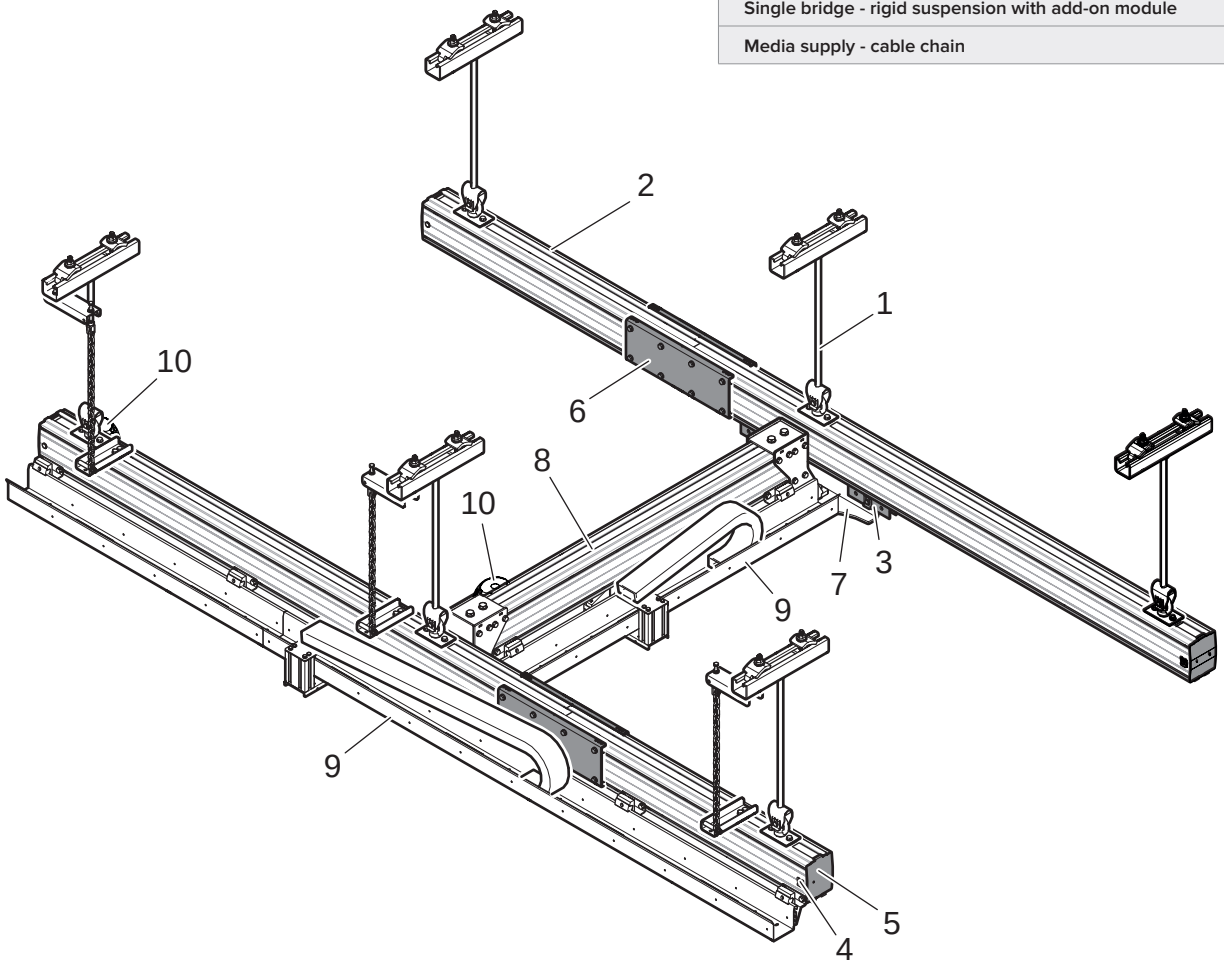


Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(C) Long	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 46	
8	Rail, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

Hanger (C) Long is used when the overhead beams are higher up than necessary, and the runway system needs to be hanging low.
Triangular bracing provides a rigid mounting that only allows movement in the direction of the runway rail.

Example 4: Single bridge with add-on module

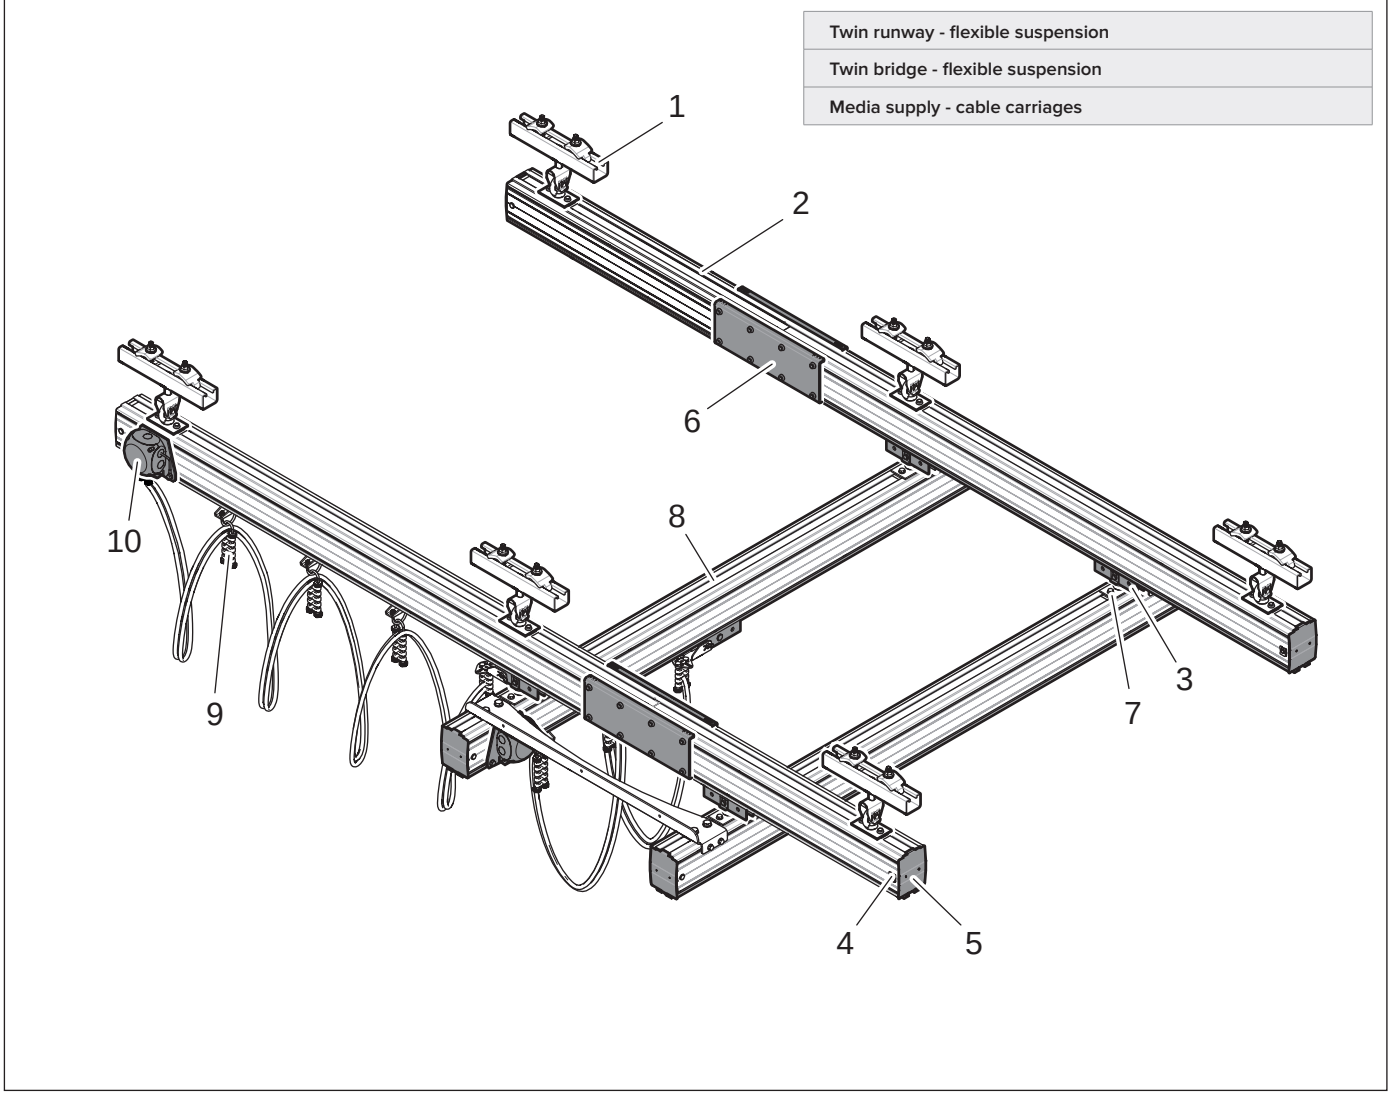
Twin runway - flexible suspension, hanging low
Single bridge - rigid suspension with add-on module
Media supply - cable chain



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(B) Middle	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Add-on module	page 47	
8	Rail, bridge	AHB140	page 28	
9	Media supply	Cable chain	page 76	
10	Connecting unit	AHB140/190	page 84	

Add-on module in the bridge minimizes the total height of the runway system and is used in buildings with low ceiling height.

Example 5: Twin bridge

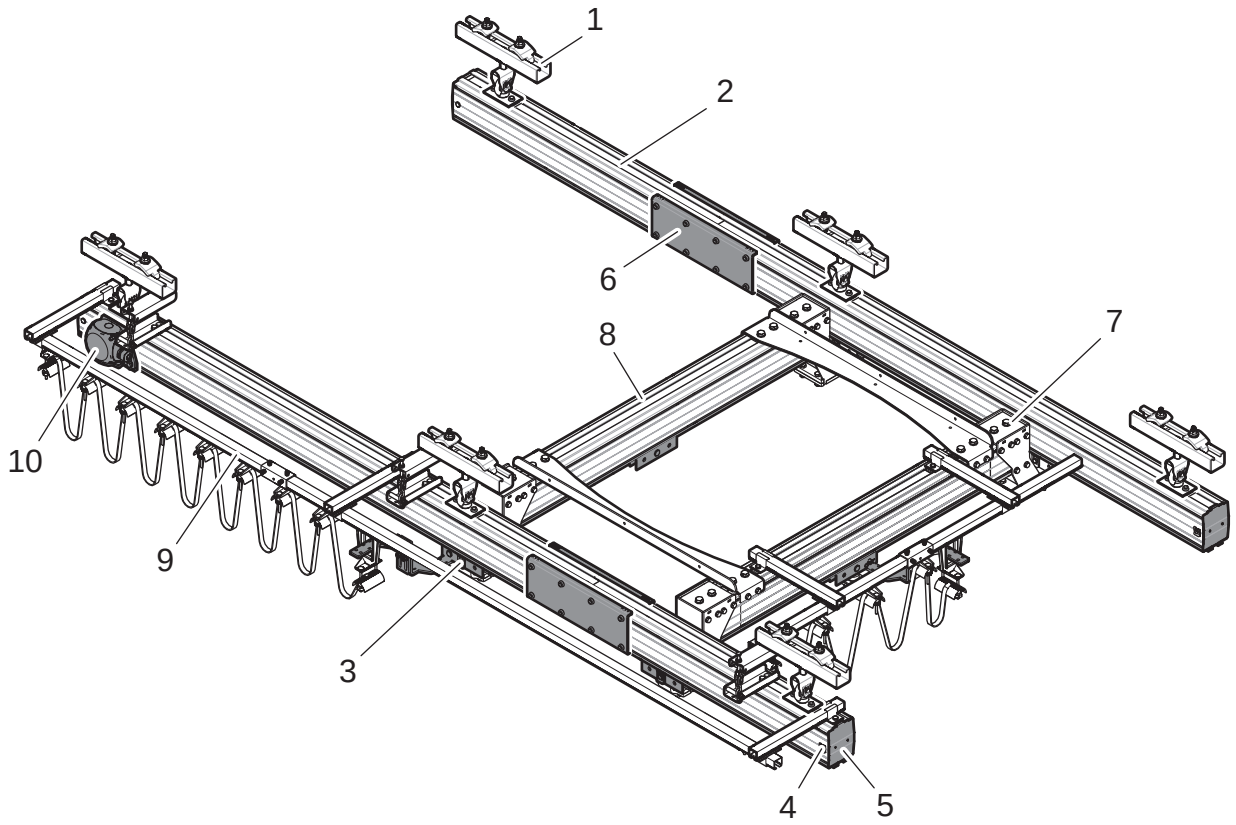


Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Crane beam suspension (A)	page 44	
8	Rail, bridge	AHB140	page 28	
9	Media supply	Cable carriage	page 61	
10	Connecting unit	AHB140/190	page 84	

Twin runway with twin bridge suspended in crane beam suspension (A) is the most common way to configure a rail system when using torque absorbing lifters.

Example 6: Twin bridge with add-on module

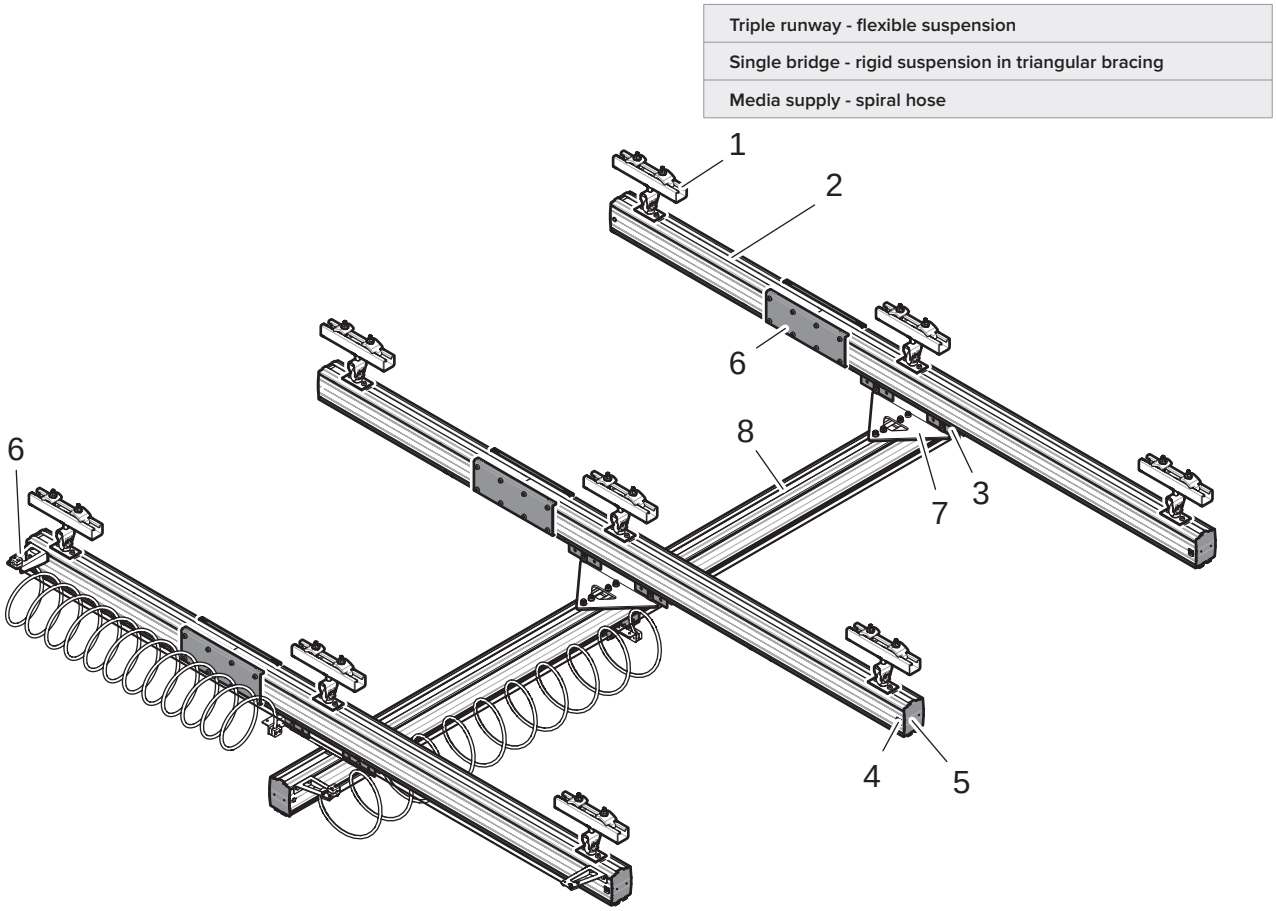
Twin runway - flexible suspension
Twin bridge - rigid suspension with add-on module
Media supply - cable trolleys in C-rail



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Add-on module	page 47	
8	Rail, bridge	AHB140	page 28	
9	Media supply	Cable trolley in C-rail	page 68	
10	Connecting unit	AHB140/190	page 84	

A cable trolley in C-rail is used to be able to range over a longer work area, and to avoid cables and hoses hanging down in the work area.

Example 7: Triple runway

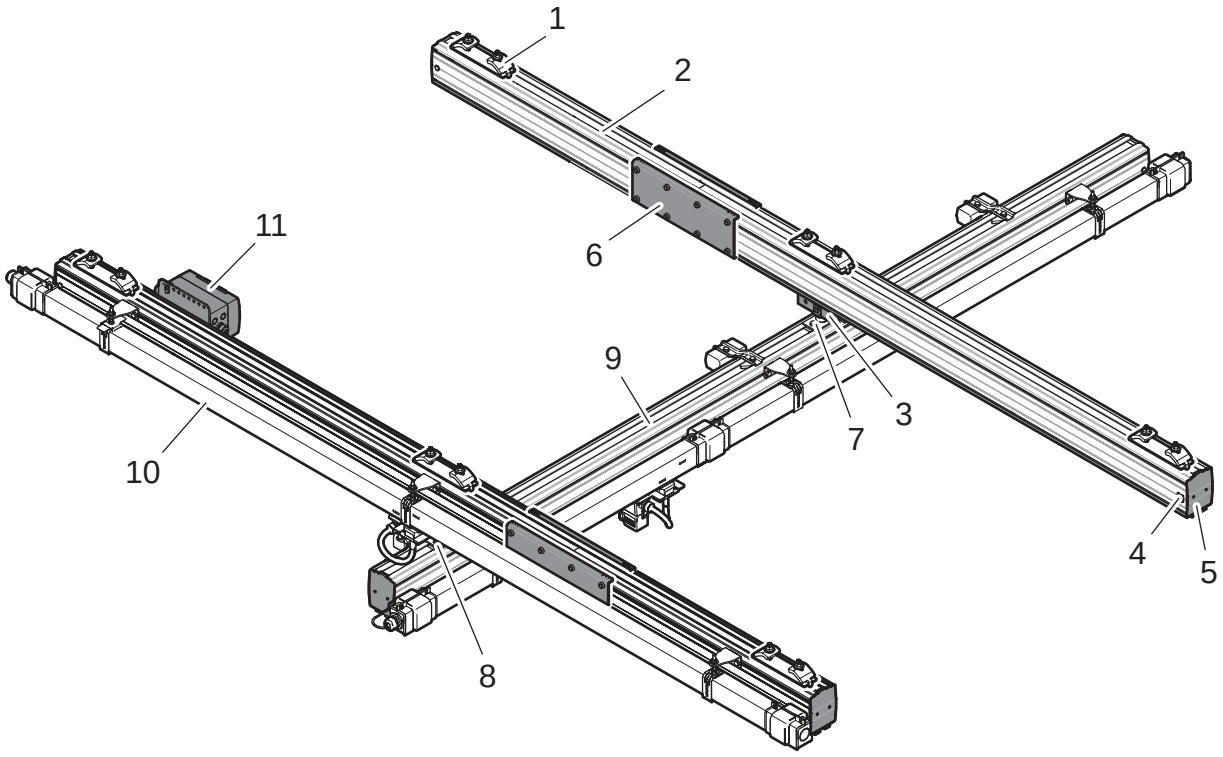


Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(A) Short	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 46	
8	Rail, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

Triple runway system makes it possible for the bridge to have a larger span.

Example 8: Single bridge with overhang

Twin runway - rigid suspension, closely mounted
Single bridge - flexible suspension
Media supply - power rail

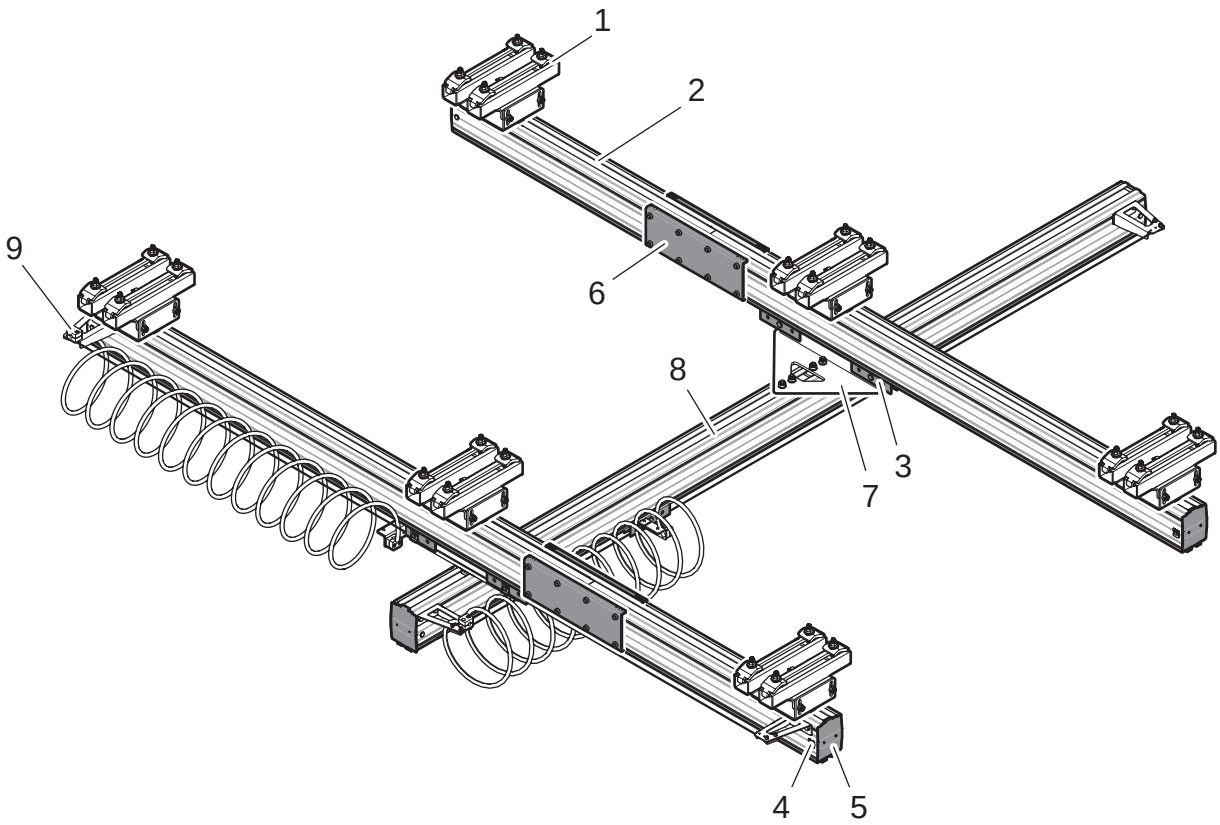


Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(D) Closely mounted	page 32	
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Crane beam suspension (A)	page 44	
8	Bridge suspension	Crane beam suspension (C) - ball joint	page 44	For forces directed upwards
9	Rail, bridge	AHB140	page 28	
10	Media supply	Power rail	page 79	
11	Connecting unit	Fuse box AHB140/190	page 84	

The preferred solution when supplying power to several bridges.

Example 9: Closely mounted single bridge with overhang and triangular bracing

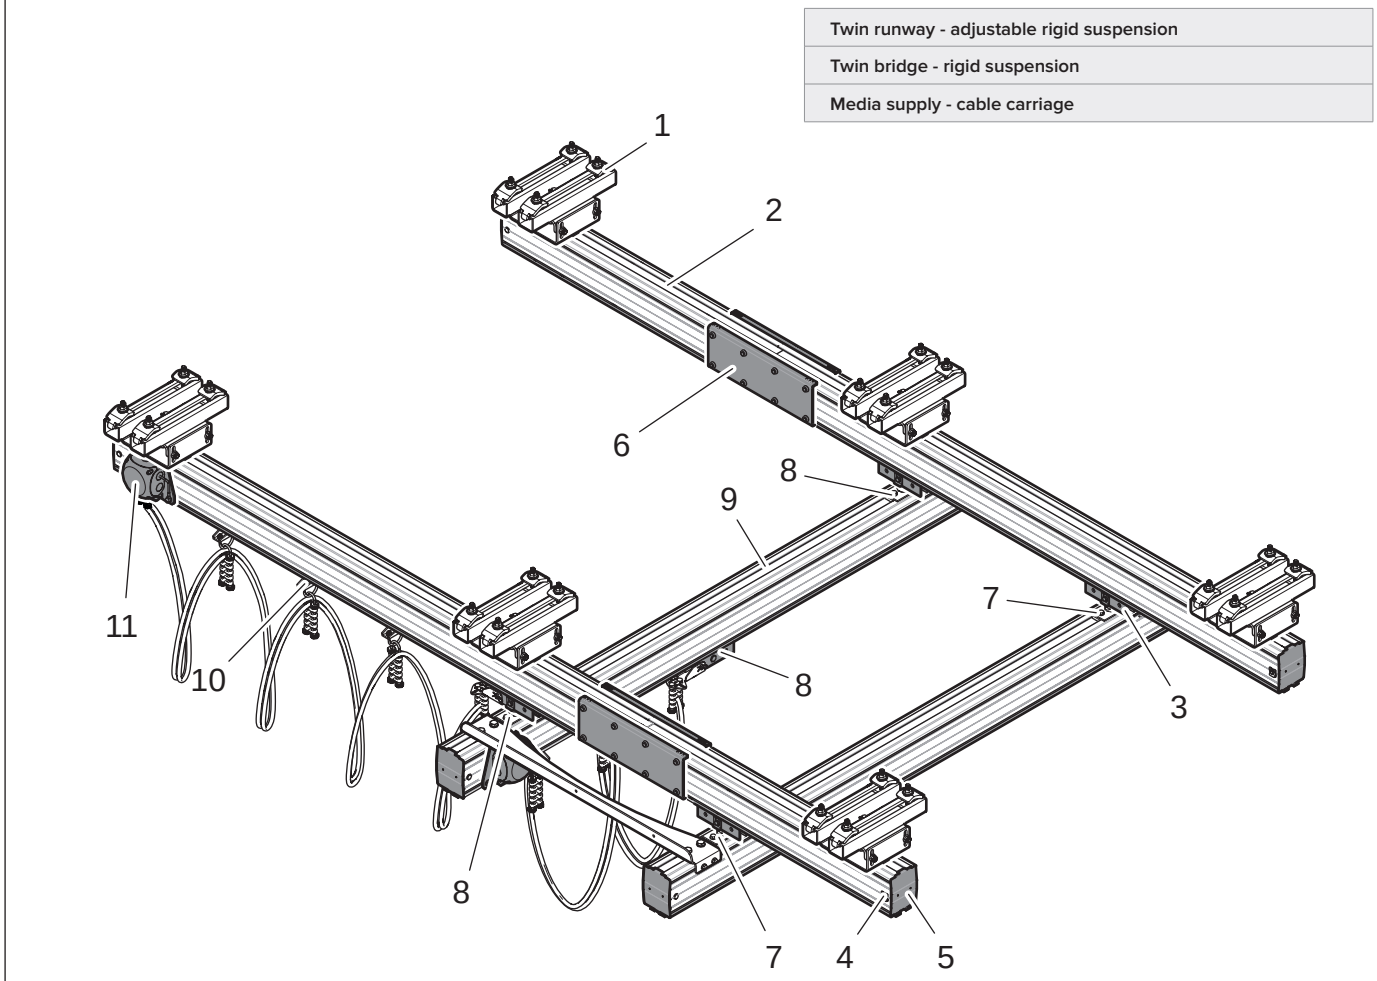
Twin runway - adjustable rigid suspension
Single bridge - rigid suspension in triangular bracing
Media supply - spiral hose



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Closely mounted, adjustable	page 32	For forces directed upwards
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Triangular bracing	page 47	For forces directed upwards
8	Rail, bridge	AHB140	page 28	
9	Media supply	Spiral hose	page 59	

Closely mounted, adjustable suspension (F) is used for systems that have a single bridge, subject to forces directed upwards, e.g. when the bridge has a major part hanging outside the runway, or in case of a telescoping bridge.

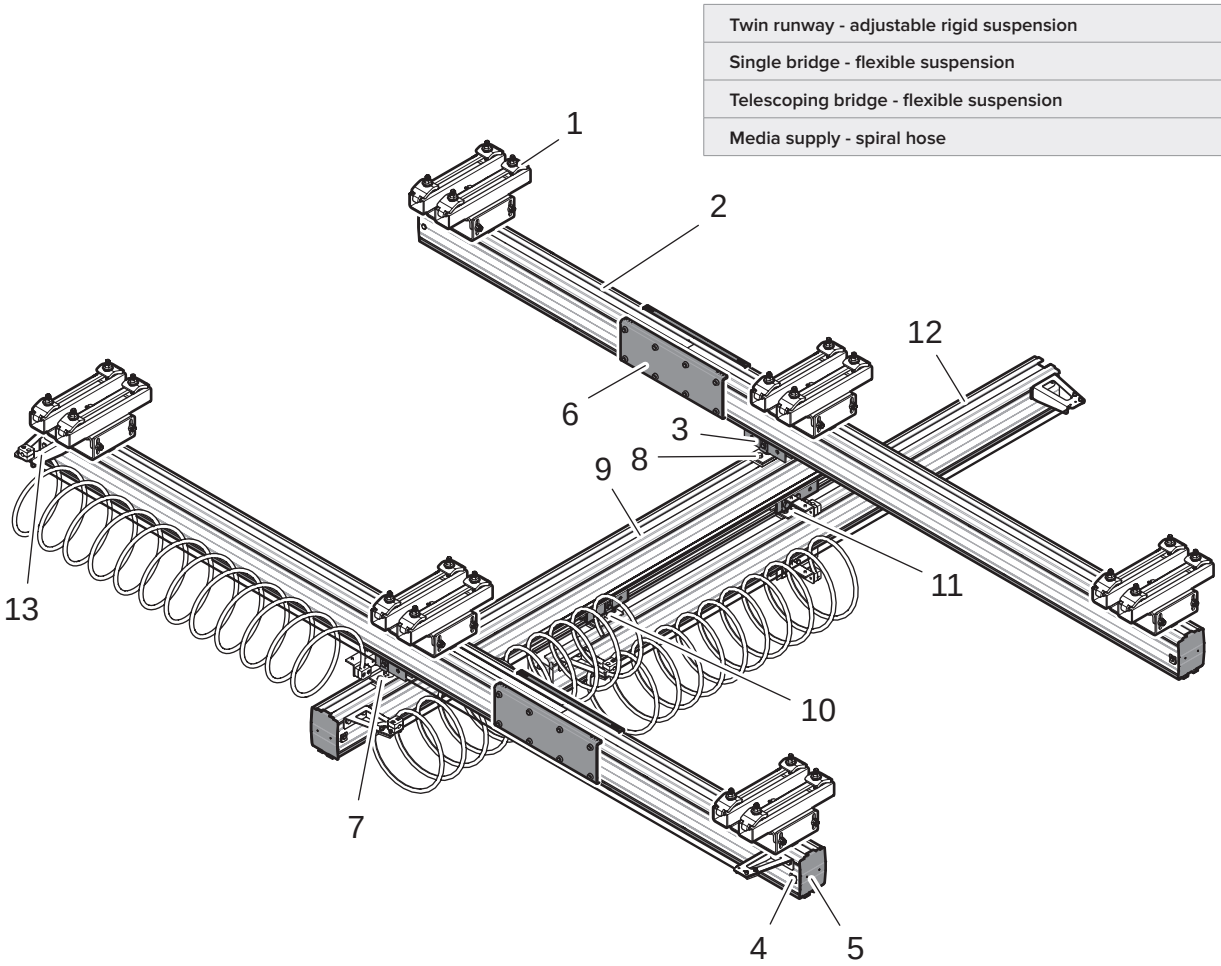
Example 10: Closely mounted twin bridge



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Closely mounted, adjustable	page 32	For forces directed upwards
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Crane beam suspension (C)	page 44	For forces directed upwards
8	Bridge suspension	Crane beam suspension (A)	page 44	
9	Rail, bridge	AHB140	page 28	
10	Media supply	Cable carriage	page 61	
11	Connecting unit	(C) Round / round	page 84	

Closely mounted, adjustable suspension (F) is used for systems that have a twin bridge subject to forces directed upwards, e.g. when using torque absorbing lifters, or in case of a telescoping crane.

Example 11: Telescoping single bridge



Pos.	Component	Type	Section catalogue page	Note
1	Suspension of runway	(F) Closely mounted, adjustable	page 32	For forces directed upwards
2	Rail, runway	AHB140	page 28	
3	Trolley	(A) Single trolley	page 38	
4	End stop	AHB140/190	page 40	
5	End cover	AHB140	page 42	
6	Fishplate kit	AHB140	page 43	
7	Bridge suspension	Crane beam suspension (C) - ball joint	page 44	For forces directed upwards
8	Bridge suspension	Crane beam suspension (A)	page 44	
9	Rail, bridge	AHB140	page 28	
10	Suspension of telescoping bridge	Crane beam suspension (C)	page 44	For forces directed upwards
11	Suspension of telescoping bridge	Crane beam suspension (A)	page 44	
12	Rail, telescoping bridge	AHB140	page 28	
13	Media supply	Spiral hose	page 59	

A telescoping bridge is used e.g. when the crane rail needs to extend over an assembly line but to be out of the way as items move along the assembly line.

PLANT DESIGN

Plant Design – EConfig

The Mechrail aluminium lightweight overhead hoist system is a modern and modular system for loads up to 1000 kg.

It is vital that the plant design is done correctly. Therefore it is necessary to read and understand the section Plant Design.

When deciding the size of the Mechrail lightweight overhead hoist system, we recommend that you use the Movomech web based configuring tool - EConfig, at http://www.movomech.se.

Rated capacity

The rated capacity is the maximum load that the runway system is designed to carry in a certain configuration and in normal operation. The load includes the weight of the lifting equipment and the gripping tools, the weight of the lifted item, and dynamic forces arising from the operations.

When operating with torque absorbing lifting tools, telescoping bridges, etc., the toughest load case will be used for calculating the design.

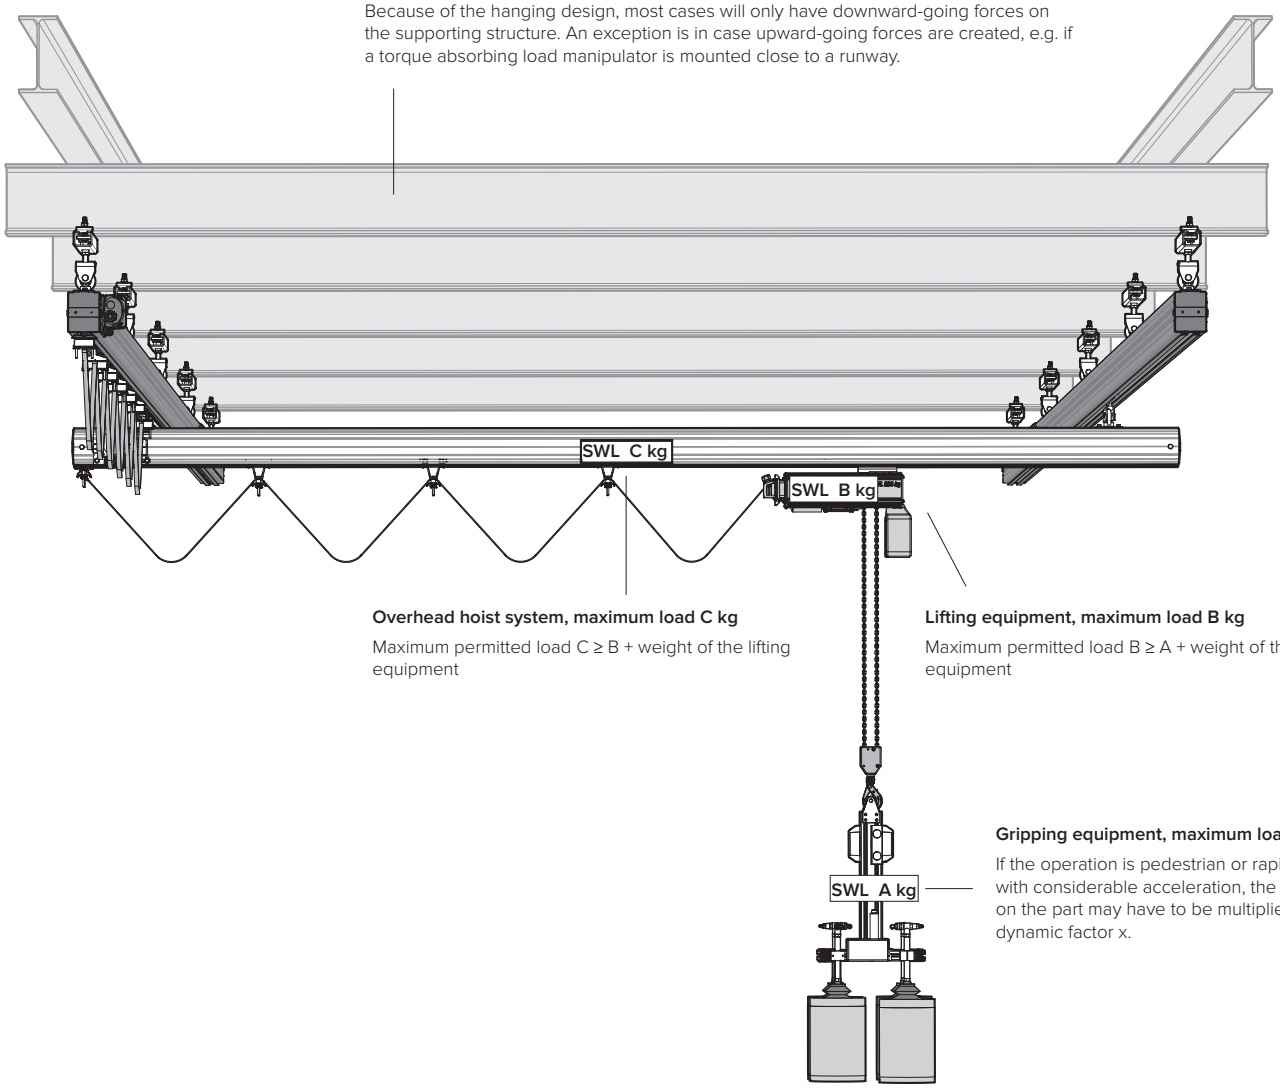
Marking with the Maximum Permitted Load

The overhead hoist system has a modular design and may be equipped with various types of lifting equipment. The main rule is that any part of the handling solution must be clearly marked with its respective maximum permitted load, see example below.

Ceiling-mounted steel structure

This design must be dimensioned for the forces acting on it when in operation, and this must be verified before commissioning the overhead hoist system.

Because of the hanging design, most cases will only have downward-going forces on the supporting structure. An exception is in case upward-going forces are created, e.g. if a torque absorbing load manipulator is mounted close to a runway.



Overhead hoist system, maximum load C kg

Maximum permitted load C ≥ B + weight of the lifting equipment

Lifting equipment, maximum load B kg

Maximum permitted load B ≥ A + weight of the lifting equipment

Gripping equipment, maximum load A kg

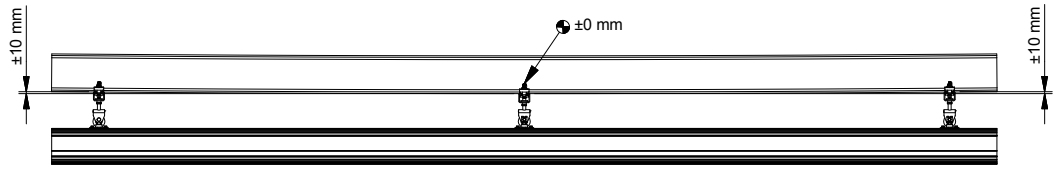
If the operation is pedestrian or rapid and with considerable acceleration, the loading on the part may have to be multiplied by a dynamic factor x.

Example of marking for maximum permitted load for each level respectively in a simple ceiling-mounted overhead hoist system.

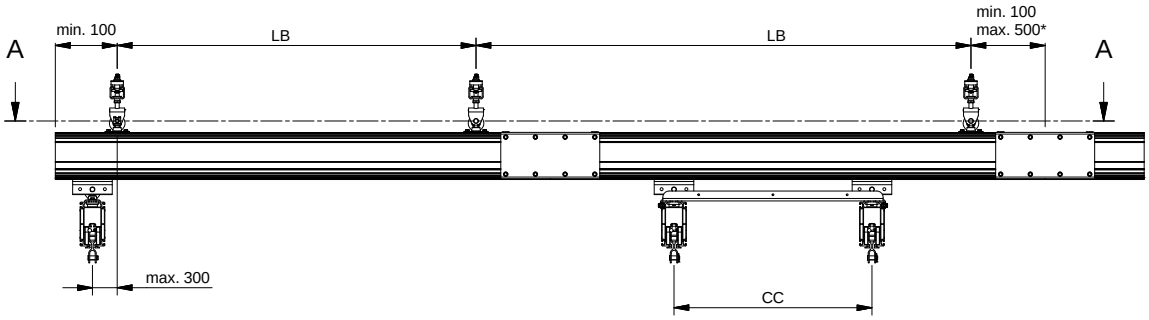
TOLERANCE REQUIREMENTS AND INSTALLATION DIMENSIONS

Horizontal level - overhead beams

The overhead beams mustn't exceed the tolerance ±10 mm in the horizontal level



Installation Dimensions



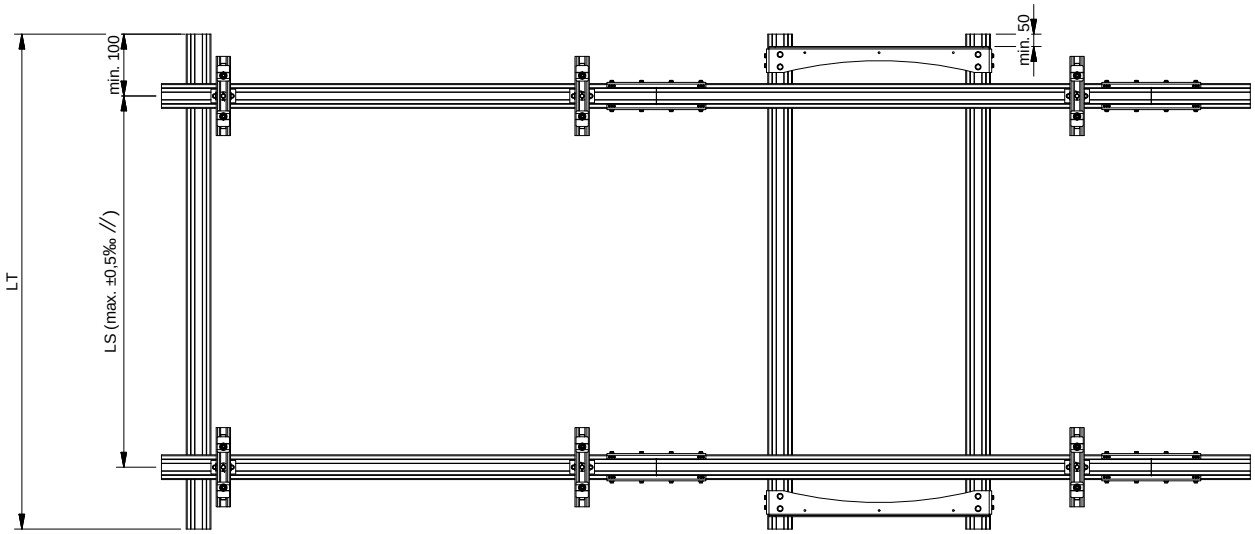
LB = runway hanging distance
LT = bridge length
LS = bridge span
CC = distance centre to centre, twin bridge
X = component-dependant distance

INFORMATION

Only one fishplate may be fitted within the hanging distance LB and the distance from the hanger to the fishplate may not exceed 500 mm. A fishplate may only be used for bridges in three-string overhead hoist systems. The above does not apply for AHB140/190 where the joint may be placed anywhere, but **the minimum distance from hanger to joint must always be 100 mm.**

Parallelism - twin runway

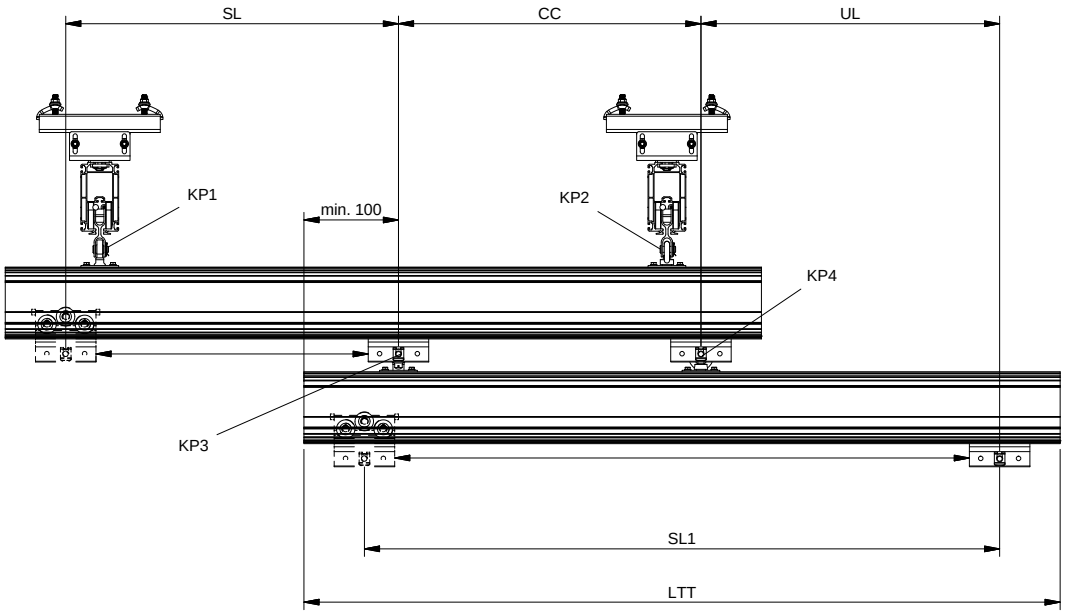
The hangers for a twin runway cannot exceed the tolerance ±0.5 ‰ for parallelism



Straightness - runways

Hangers for a runway must be placed with less deviation than ±2 mm from the intended path of the runway.

Telescoping bridges



INFORMATION

Get in touch with Movomech if your application requires a telescoping bridge.

Hangers D or F (see page 32) to be used with runway rails.

Crane beam suspension C - Ball joint to be used for KP1 single bridge.

Crane beam suspension C to be used for KP1 twin bridge.

Crane beam suspension A to be used for KP2.

Crane beam suspension C to be used for KP3

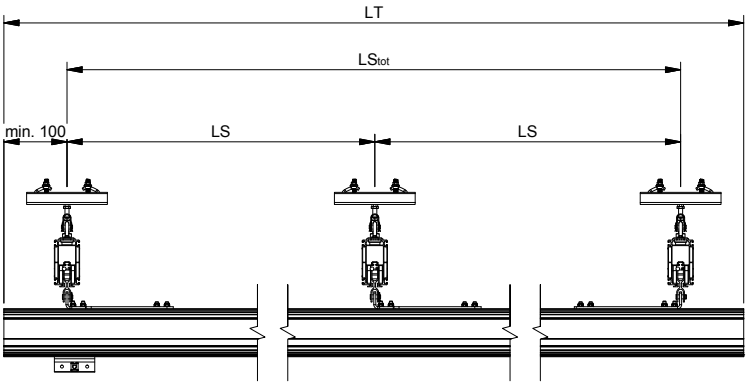
Crane beam suspension A to be used for KP4.

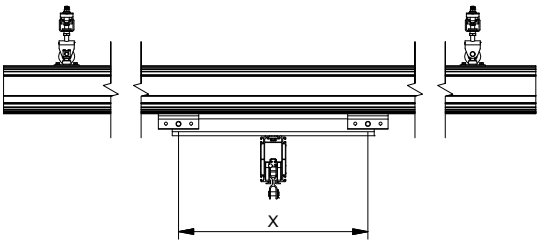
An inverted trolley may be required for KP1 and/or KP3.

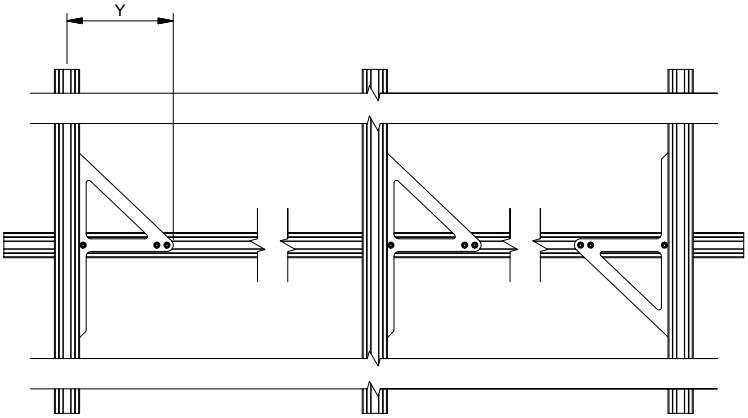
A twin trolley may be required for KP4.

SL = bridge stroke
SL1 = telescoping hoist stroke
CC = distance between hangers
UL = overhang
LTT = length telescoping bridge
KP = connection point

Three-stringed system







LS = bridge span
LS_{tot} = bridge total span
LT = bridge length
X = see "Triangular bracing" on page 46
Y = see "Triangular bracing" on page 46

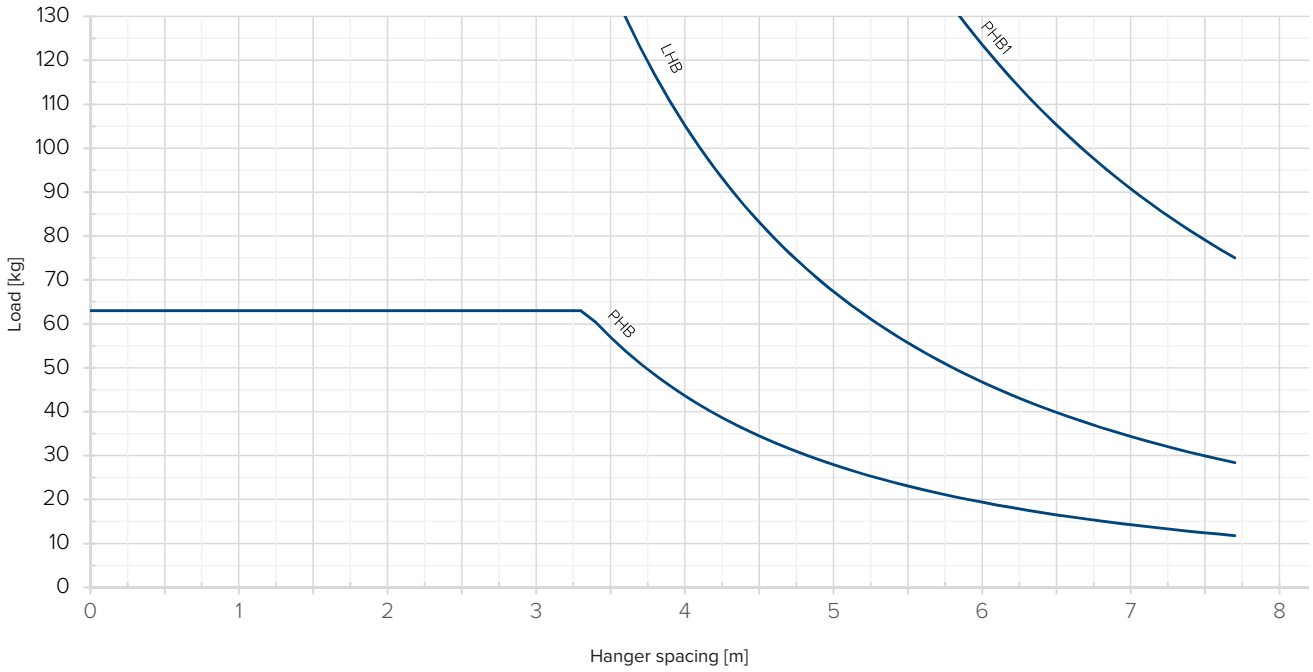
LOADING CHART

The loading charts show the maximum spacing for the hangers in a runway or bridge for a given load.

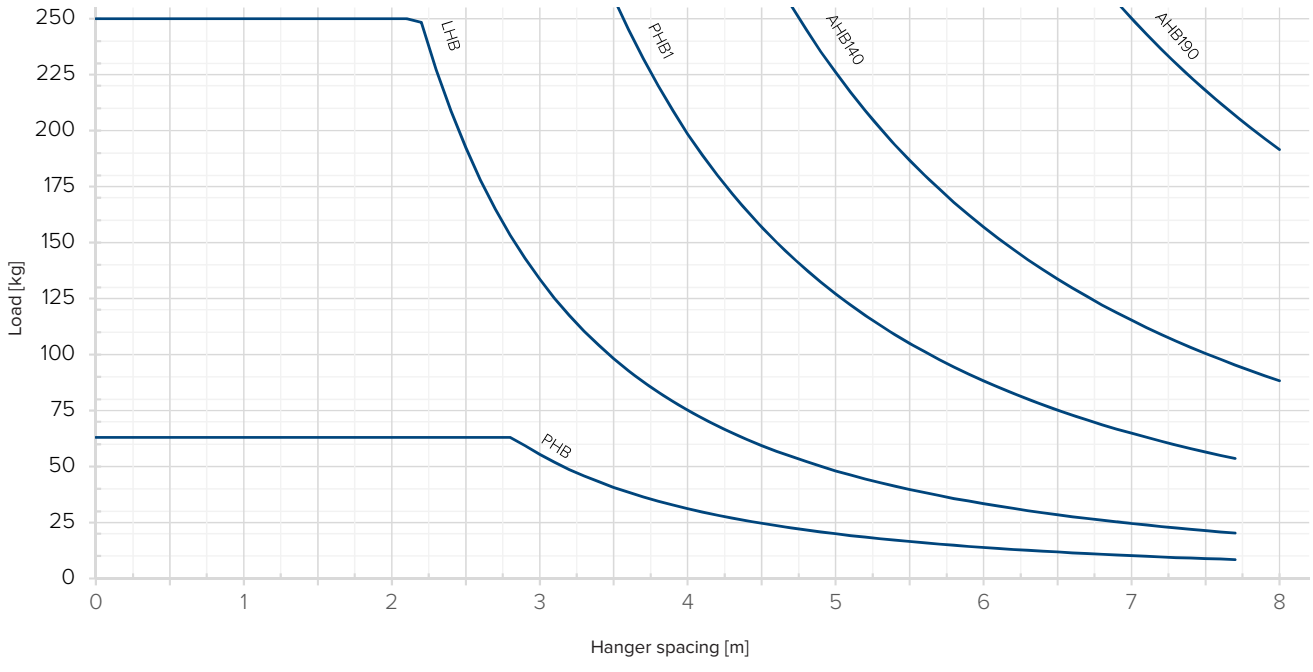
Permitted deflection 1/250

Only permitted when using vacuum lifting tools with small dynamic forces. Loads up to 125 kg.



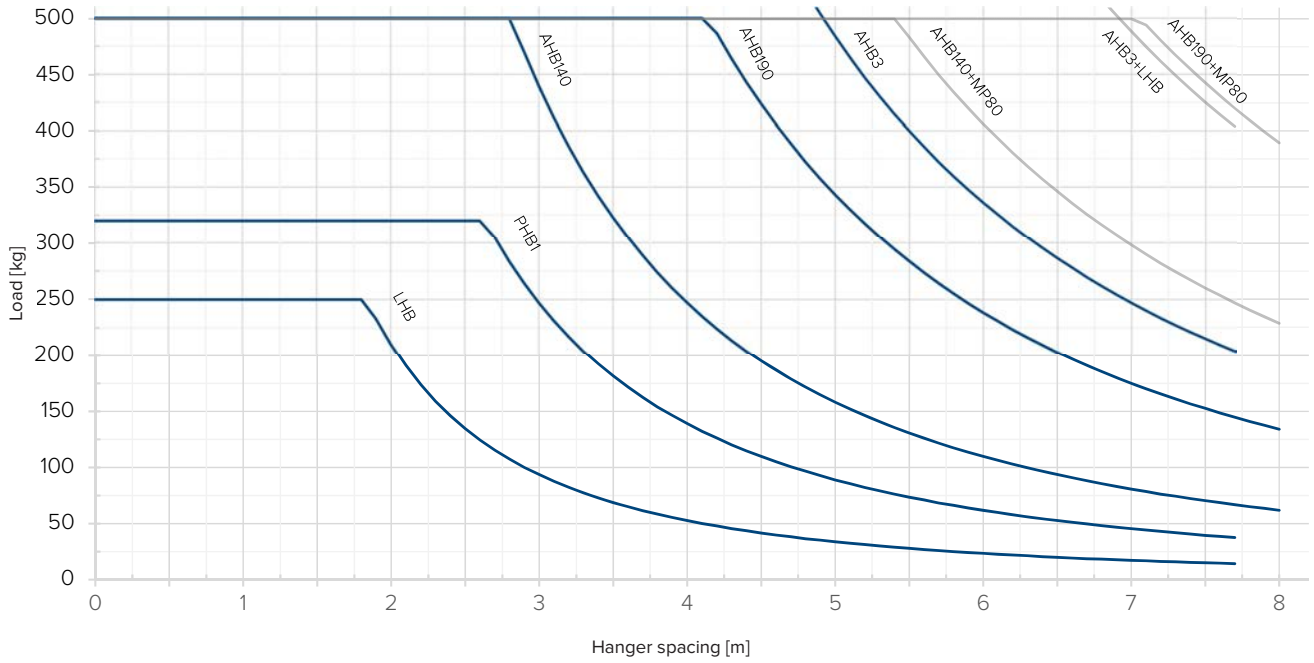
Permitted deflection 1/350

Used with pneumatic lifting tools with small to medium dynamic forces. Loads up to 250 kg.



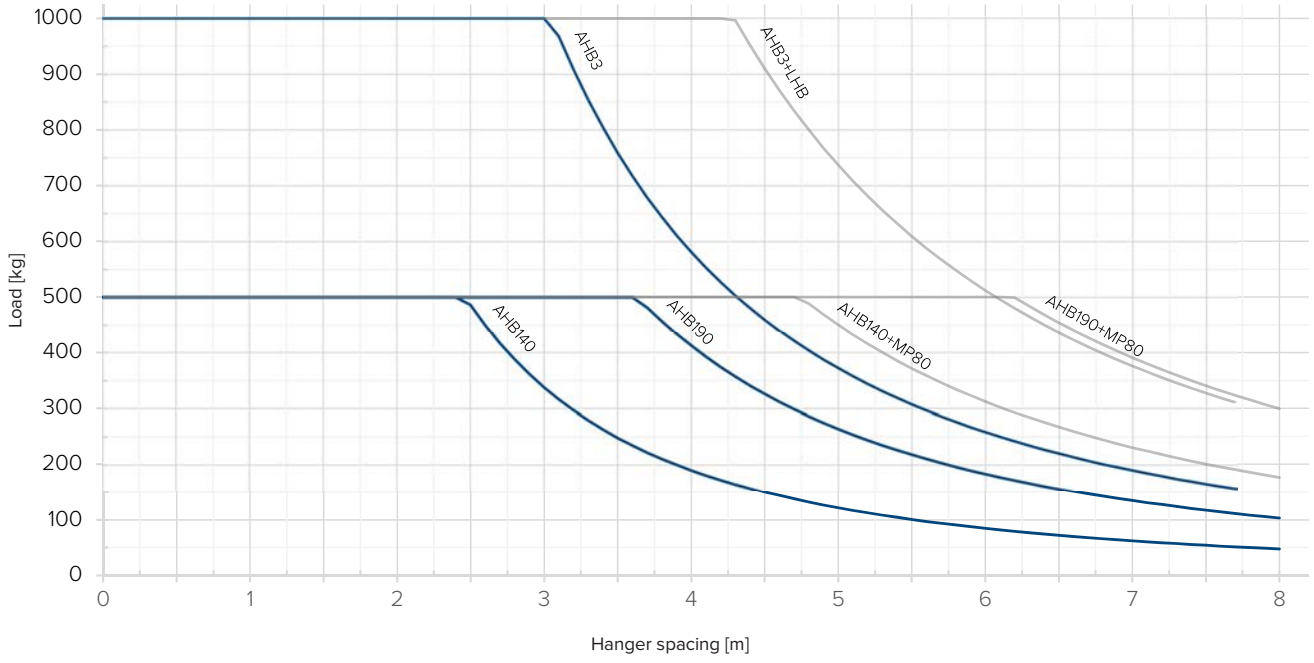
Permitted deflection 1/500

General use with all lifting applications with small to medium dynamic forces. Loads up to 500 kg.



Permitted deflection 1/650

General use with all lifting applications with large dynamic forces. Loads up to 1000 kg.



CLASSIFICATION OF OPERATIONS

Permitted operation classes for Mechrail considering fatigue strength.

		Total number for cyclic stress (fatigue life)			
		N1	N2	N3	N4
		Intermittent, non-regular operations with long periods of non-activity	Regular operations with intermittent use	Regular operations with continuous use	Regular operations with heavy continuous use
Loadings		< 200 000	200 000 - 600 000	600 000 - 2 000 000	> 2 000 000
S0	Very small changes of loads. Gentle operational use.	B1	B2	B3	B4
S1	Small changes of loads. Careful operational use.	B2	B3	B4	B5
S2	Average change of loads.	B3	B4	B5	B6
S3	Large changes of loads. Heavy operational use.	B4	B5	B6	B6

The following reduction factor must be observed when calculating the permitted capacity for trolleys and suspension components:

Trolley	B1	B2	B3	B4	B5	B6	
without any rail joints	1.0	1.0	1.0	1.0	0.8	0.7	} x the capacity
with rail joints	1.0	1.0	0.9	0.75	0.65	0.55	

Suspension component	B1	B2	B3	B4	B5	B6	
	1.0	1.0	1.0	1.0	0.8	0.7	x the capacity

SAFETY WIRE

For the suspension

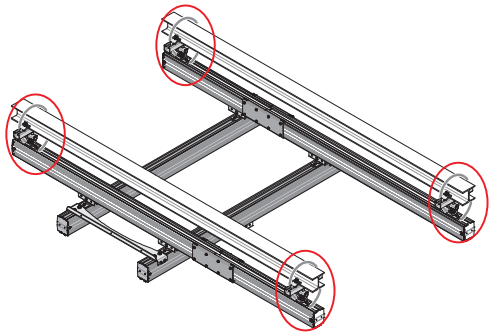
INFORMATION

Safety wires are used to secure the runway to the overhead beams.

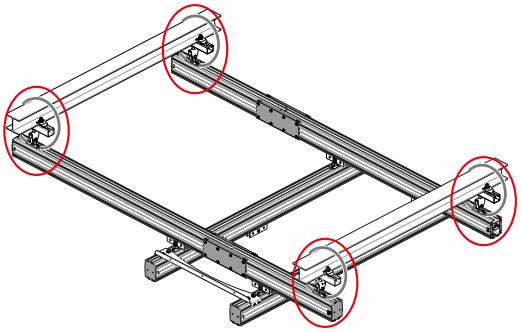
This is recommended when only two hangers are holding a runway length, e.g. with a transverse steel beam where an added hanger cannot be fitted, as well as for cases with critical loads.

The length of the wire is to be adapted to each case.

Sea also "Safety wire for hngers" on page 36.



Longitudinal steel beam, suspension safety wire fitted



Transverse steel beam, suspension safety wire fitted

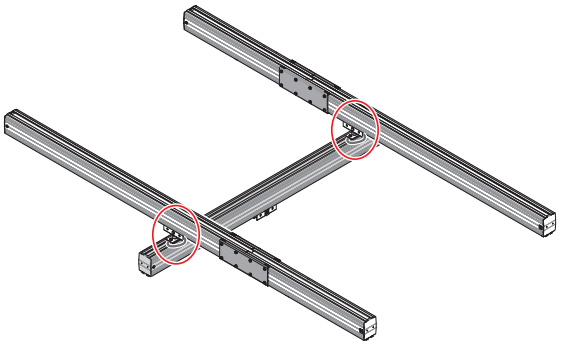
For bridge

INFORMATION

A safety wire is used for a bridge to secure the crane beam suspension to the trolley.

Movomech recommends that these are used with single bridges.

See also the section "Safety wire for bridges" on page 49.



Safety wire for bridge fitted

Reinforcing bracket

Rail LHB

Combination	I_x [cm⁴]	m [kg/m]	Note
AHB3 + LHB	3500	15.3	

INFORMATION

A reinforcing rail is used to reduce the deflection of long spans.

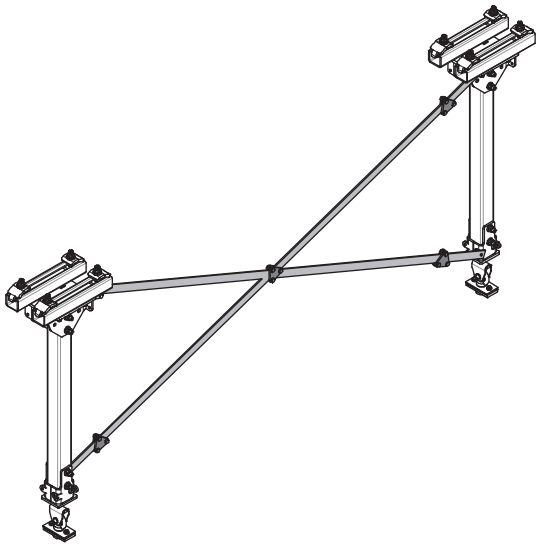
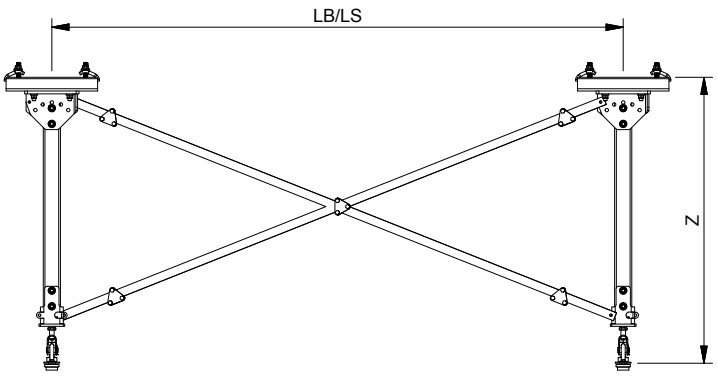
Suspension cross brace (C)





#	m [kg]	Note
743918	21	

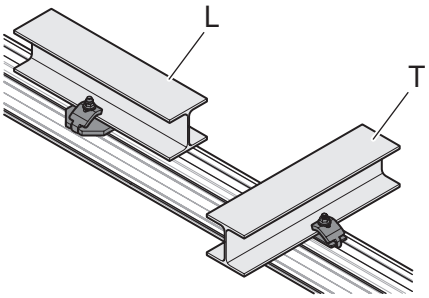
INFORMATION

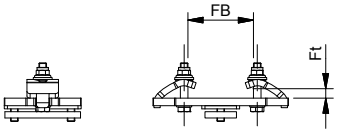
A cross brace is recommended at Z > 1000 mm and/or in case of large dynamic forces in the rail system.

Cross braces are supplied as kits to fit in between two hangers. Max LB/LS = 7.5 m.

The cross braces may have to be cut to length when used together with a combination of a short LB/LS and a Z.

(D) Closely mounted





INFORMATION

Cannot be used together with an add-on module for bridge.

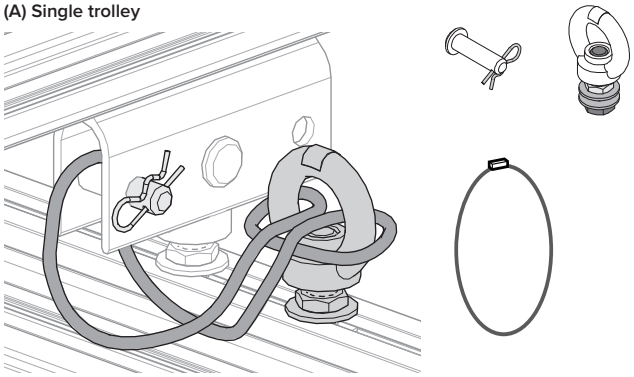
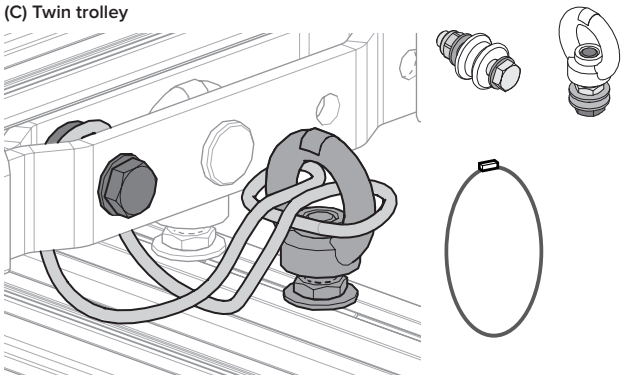
SAFETY WIRE FOR BRIDGES

30s

(A) Single trolley



(C) Twin trolley



INFORMATION

A safety wire is used for a bridge to secure the crane beam suspension to the trolley. Movomech recommends that these are used with single bridges.

Supplied as a kit. Secures one crane beam suspension.

See also the section "Safety wire" on page 27.

INFORMATION

Travel limiters (C) and (D) are hydraulically dampened.
These are used for rail systems with large moving forces and in case there is a lot of operations at the end sections of the work area.
ATTENTION! Cable trolleys cannot pass (C)!

SL = stroke [mm]
E_{max} = maximum energy consumption per cycle [Nm]
E_{max}/h = maximum energy consumption per hour [Nm/h]
V_{max} = maximum impact velocity [m/s]
F_{max} = maximum impact force [N]

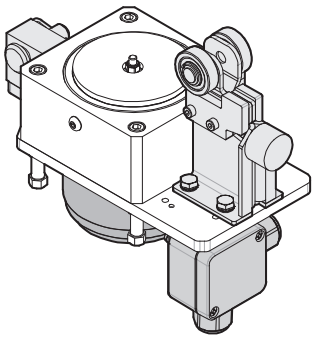
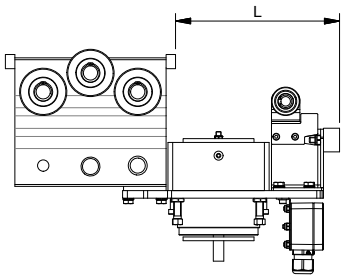
PARKING BRAKES





INFORMATION

The support wheel unit can be divided for fitting on a rail.

A reverse brake is spring actuated when it is not energized.

A: Electric 230 V / 82 W

B: Reverse electric 230 V / 82 W

C: Pneumatic

D: Reverse pneumatic

E: Pneumatic with solenoid valve 24 VDC / 4.5 W

F: Reverse pneumatic with solenoid valve 24 VDC / 4.5 W

G: Pneumatic with solenoid valve 230 VAC / 9

R: Reverse pneumatic with solenoid valve 230 V / 9 W

ATTENTION! Electrical work is only permitted to be performed by a trained electrician.

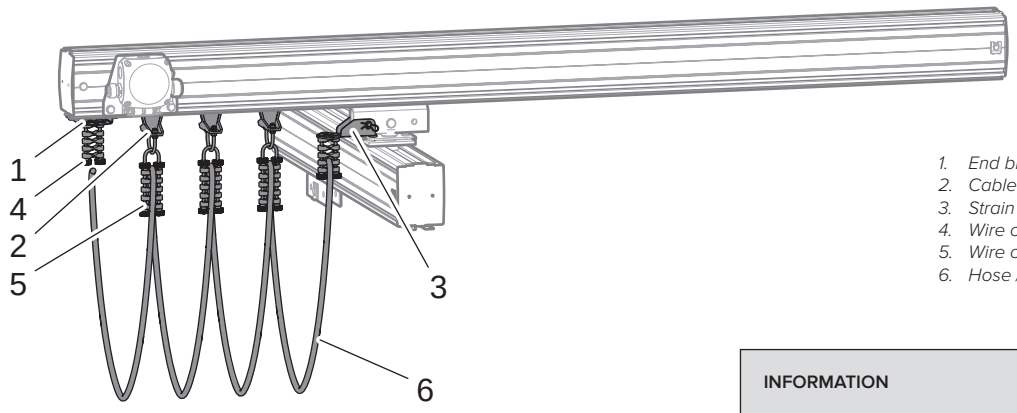
CABLE TROLLEY FOR TRACK RAIL



1. *End bracket*
2. *Cable carriage*
3. *Strain relief*
4. *Wire clamp, fixed*
5. *Wire clamp, shackle*
6. *Hose / round cable*

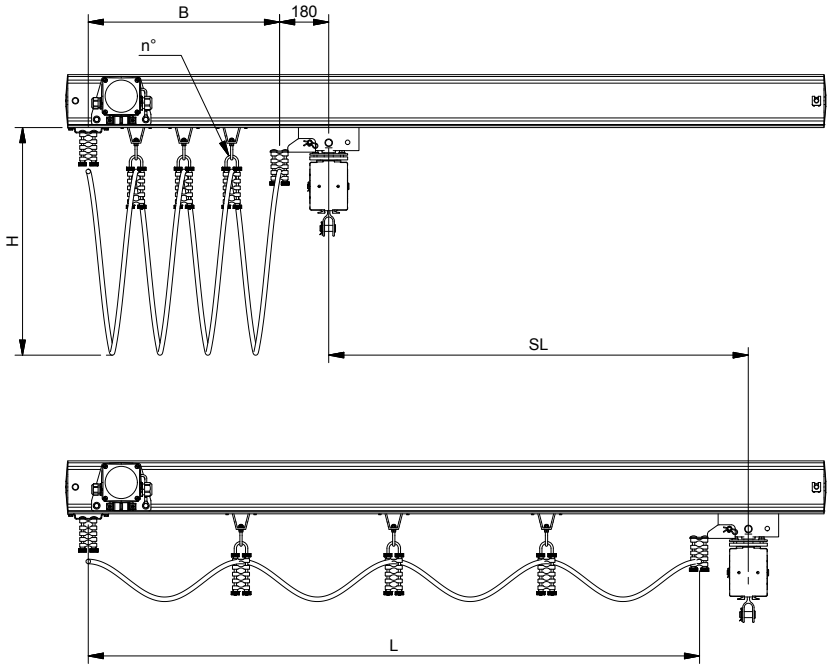
INFORMATION

Cable trolleys should have travel limiters to prevent the hoist trolley colliding with the cable trolleys and creating unnecessary wear.

Cables and hoses are available by the meter.

There are four types of cable trolleys:
(A) flat cable channel, maximum width 15 mm
(B) link chain for hose and / or round cable Ø10 - 36 mm
(C) strap for vacuum hose, max Ø90 mm
(B) shackle for hose and / or round cable Ø8 - 22 mm

Wire clamps for (B) can rotate 360° in end fittings, cable trolleys and strain reliefs.
Wire clamps for (D) cannot rotate in end fittings and strain reliefs and is limited to 90° in cable trolleys which has the advantage of neither hose nor cable twisting.



SL = stroke [m]
B = buffer [m]
L = minimum length of cable/hose [m]
H = pendant [m]
n° = number of cable trolleys

$L = SL_{max} \times 1.2$
$n° = (L / 2H) - 1$
$B_{min} = (n° + 1) \times 0.1$
$H_{max} = 0.6$

Sample calculation for SL = 12 m, H = 0.4 m:

L2	*= 12 x 1.2*	*14.4 m*
n°	*= (14.4 / 0.8) - 1*	*qty 17*
B	*= (17 + 1) x 0.1*	*1.8 m*

INFORMATION

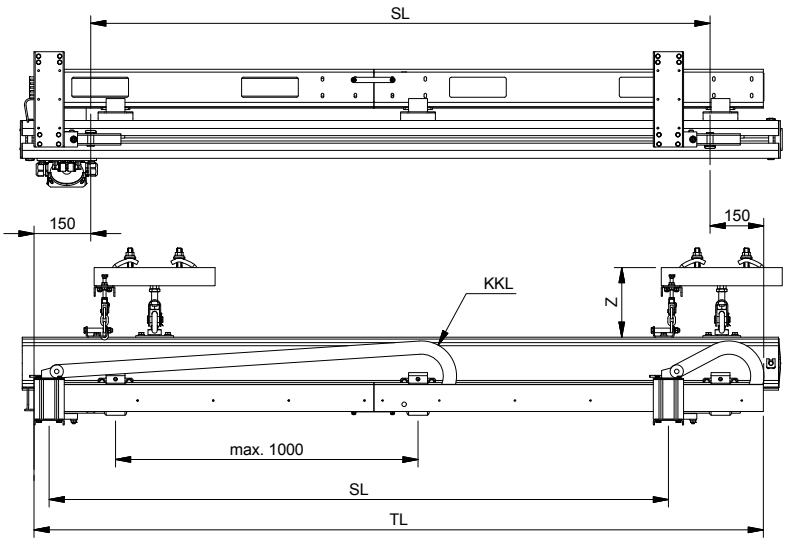
Fits only AHB 140 / 190.

An earth cable is use for earthing and the equalization of potentials between rails / tracks, or between rail / track and earthed component.

If the connection is painted or coated in any way, the coating must be removed to create a satisfactory connection.

In case of SL >4 m, half of the troughs must be fitted with slide strips.



SL = stroke [m]
TL = trough length [m]
KKL = Cable chain length [m]

TL = SL + 0.3
KKL = (SL / 2) + 0.5

Sample calculation for SL = 4 m:

TL = 4 + 0.3	*4.3 m*
KKL = (4 / 2) + 0.5	*2.5 m*

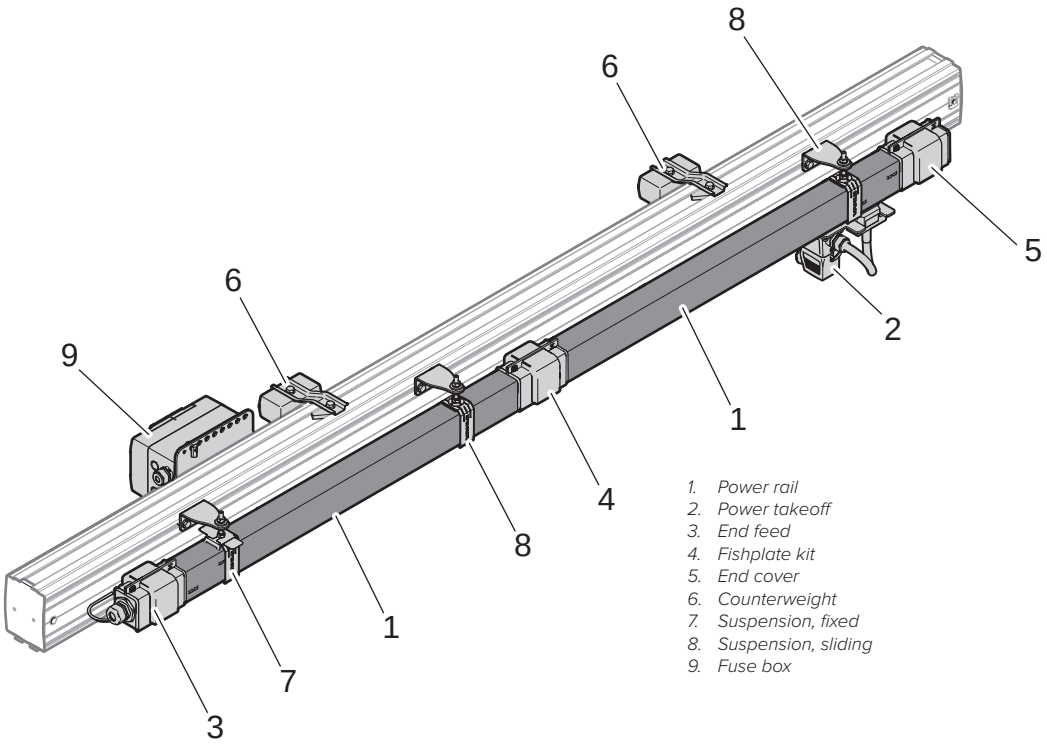
POWER RAIL

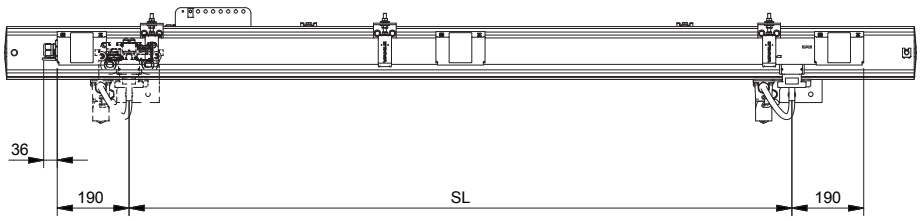


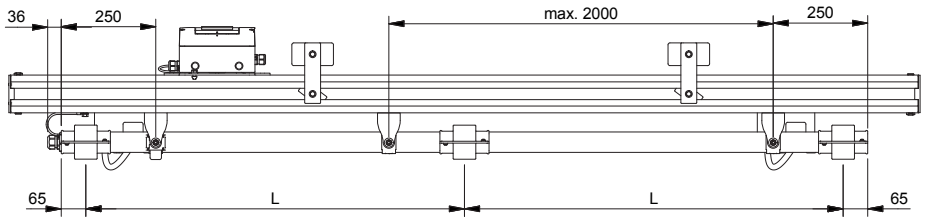
1. *Power rail*
2. *Power takeoff*
3. *End feed*
4. *Fishplate kit*
5. *End cover*
6. *Counterweight*
7. *Suspension, fixed*
8. *Suspension, sliding*
9. *Fuse box*

INFORMATION

The end feed must have a fixed suspension, the rest must be sliding. Each bridge must have its own fuse box if the bridge is supplied with power from a conductor rail in the track. A counterweight is used to prevent the rail from hanging askew.

ATTENTION! Electrical work is only permitted to be performed by a trained electrician.





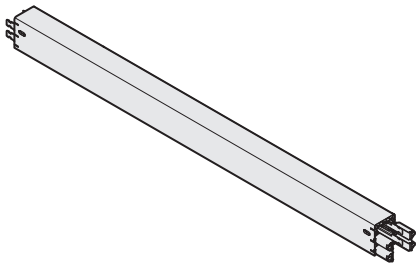
SL = stroke [m]
L = power rail length [m]
L_{tot} *= power rail total length [m]*

$L_{tot} = SL + 0.2$

Sample calculation for SL = 5 m:

$L_{tot} = 5 + 0.2$ *5.2 m*

Power rail



#	L [m]	m [kg]	Note

735350	B	0.3	10	350	5 - 60	
743057	C	0.01	10	240	5 - 60	

INFORMATION

A: purge valve, pressure regulator with manometer and filter (manual purging)

B: purge valve, pressure regulator with manometer and filter (manual purging), pneumatic unit (4 outlets), microfilter.

C: purge valve, pressure regulator with manometer and filter [manual purging], pneumatic unit (1 outlets), microfilter, sub-microfilter.
Used for sensitive applications, e.g. for air quality

All pneumatic units are supplied with Ø12 mm outlet connectors.

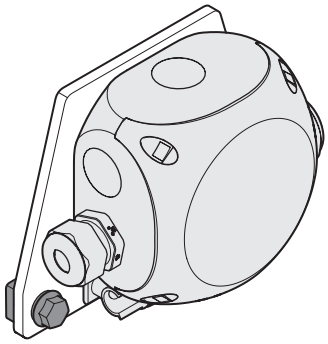
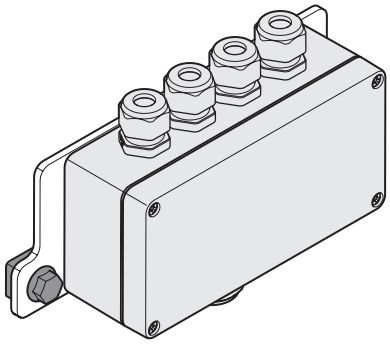
CONNECTION UNITS



(A)



(D)

INFORMATION

A connection unit (A) must be used at the power supply end of the track system and for each bridge when using electric equipment. Threaded coupling suitable for both Ø8 - 17 mm round and 15 - 18 x 5 mm flat cables.

Connection unit (D) used for e.g. limit switch:
4 x M16 threaded coupling, cable Ø5 - 10 mm
1 x M20 threaded coupling, cable Ø10 - 14 mm
Terminal block for 1.5 mm² wire included.

ATTENTION! Electrical work is only permitted to be performed by a trained electrician.
